STATEMENT OF LIMITATIONS

This document was prepared in accordance with the customary thoroughness and competence of civil and environmental engineering consulting professionals and in accordance with the standard for professional services for a national consulting firm at the time these services were provided. The analysis and conclusions expressed in this document were developed based on a limited scope of services and the information made available to AECOM Technical Services, Inc. at the time this work was conducted.

The following Technical Memorandum is a summary of the full NAHS pilot study report presented in Appendix A.

1. Introduction

1.1 PURPOSE OF THE PILOT STUDY

This technical memorandum (TM) presents the findings from the pilot study of the granular activated carbon (GAC) and ion exchange (IX) treatment system at the United States Department of the Navy's (Navy's) Aiea-Halawa Shaft (NAHS) in Aiea, Hawaii. As one part of the reactivation plan (DON 2024), the study aims to support the Navy's goal of reactivating the NAHS to enhance the resiliency and redundancy of the Joint Base Pearl Harbor-Hickam (JBPHH) public water system (PWS), which serves approximately 93,000 residents, private consumers, critical Department of Defense (DoD) industrial processes, building heating, ventilation and cooling systems, and critical emergency response and firefighting services in southern Oahu. It is a community water system as defined by Title 40 Code of Federal Regulations, Part 141, Subpart A and, prior to November 2021, was supplied by three groundwater wells, namely the Waiawa, Red Hill, and Navy Aiea-Halawa shafts.

The pilot study was designed to evaluate the effectiveness of the treatment system in removing per- and polyfluoroalkyl substances (PFAS), as well as address other constituents of concern, including total petroleum hydrocarbons (TPH) and polycyclic aromatic hydrocarbons (PAH), from the water supply at the NAHS under conditions representative of standard operation. The study's results will inform the Navy in their request to reactivate the NAHS in compliance with the United States Environmental Protection Agency (EPA) and State of Hawaii Department of Health (DOH) regulations. The Navy was granted approval to reactivate the NAHS on February 7, 2025, under the condition of completion of the pilot study as well as other requirements (DOH 2025).

The pilot study results demonstrate the removal efficiency of PFAS is in compliance with the EPA's future National Primary Drinking Water Regulations (NPDWR) at each post-treatment phase (GAC and IX Resin). Based on data collected throughout the pilot study, neither TPH nor PAHs were detected in the raw water; thus, removal efficiency of these compounds could not be evaluated in this study. GAC treatment is a proven and reliable method that is highly effective at adsorption of organic compounds onto its surface, thereby removing them from water upon contact (EPA 1991; 2000) (supporting studies included in Appendix I). Therefore, it is expected that this treatment system would effectively remove both TPH and PAHs if present in the source water.

The results of the pilot study as presented in this report support the Navy's request to reactivate the NAHS in compliance with EPA and DOH requirements. Additional information regarding the technical aspects of the entire NAHS pilot study is provided in Appendix A.

1.2 BACKGROUND

Although not affected by the Red Hill fuel release, the NAHS was isolated from the JBPHH public water supply on December 3, 2021, after the Red Hill Shaft was disconnected as an additional measure of caution by the Navy. Since then, the Waiawa Shaft remains the sole source of potable water for the entire JBPHH PWS. Since November 2020, analytical results of the NAHS raw source water samples reported several PFAS compounds above the 2024 EPA NPDWR health advisory levels that will become enforceable on April 26, 2029. The source of the PFAS compounds at the NAHS is unknown. Since temporarily removing the NAHS from service, the Navy proactively began pursuing a treatment system for the NAHS water supply to achieve compliance with all State and Federal requirements including evolving PFAS regulations. Reactivating the NAHS is a vital Navy resiliency measure providing an alternative water source to supplement the Waiawa Shaft. In addition, a final pilot study report demonstrating the efficacy of the

treatment system is a requirement imposed by DOH to reactivate the NAHS (DOH 2025). The treatment system is designed to remove potential future impacts from sources including PFAS and other fuel-related compounds like TPH and PAHs. In addition, the treatment system provided an opportunity to evaluate and document the chloride concentrations previously noted in the 2015 *Utility System Assessment of the JBPHH Potable Water System* by Engineering Concepts, Inc. (DON 2015).

1.3 DESCRIPTION OF PFAS, TPH, AND PAHS

PFAS are a collective name for a broad class of man-made chemicals of concern that have recently been in the spotlight due to potential human and environmental health risks. While public attention to PFAS is relatively new, the chemicals have been used globally since the 1940s. PFAS are considered emerging constituents of concern because research is ongoing to better understand the impacts they pose to human health, animal health, and the environment. Previous testing data at the NAHS have shown that several PFAS compounds are present at concentrations above the 2029 NPDWR levels.

TPH is defined as the total amount of petroleum-based hydrocarbons measured in an environmental sample. Petroleum hydrocarbons (PHC) refer to a family of several hundred chemicals made up primarily of carbon and hydrogen atoms that originate from crude oil and are processed (or refined) to create mixtures used for fuel, tar, lubricants, and other substances. TPHs are common environmental contaminants found in soil, water, and air. A detection of TPH does not equate to the presence of fuel. Not all PHC originate from fuel and, as discussed in detail in Section 2.3, the non-specific nature of the analytical method means that the reported concentration may have contributions from chemicals that are not PHC at all. Detections of TPH-d were reported in the NAHS raw water samples collected from various sampling ports in December 2021. There was one additional low-level TPH-d detection reported in an EPA sample collected from the raw water in June 2024. A duplicate sample was collected by EPA and the TPH-d results were non-detect. Navy's split sample results were also non-detect for TPH. **Other than this sample, no TPH has been found in the NAHS raw water since Navy began collecting samples in January 2022.** All historical NAHS sample data are provided in Appendix H.

PAHs are a sub-class of PHC, and 15 of these compounds are analyzed in this study. PAHs are primarily introduced into the environment through two broad pathways: petrogenic and pyrogenic sources.

Petrogenic PAHs originate from geological processes that form fossil fuels and are common in petroleum products. In the environment, they may originate from point sources such as oil spills, petroleum handling facilities and asphalt pavements, or from more dispersed sources such as leaking oils or fuels from individual vehicles.

Pyrogenic PAHs are formed by the incomplete combustion of organic matter, including fossil fuels, wood, and biomass. Typical sources are from vehicle exhaust and wildfires and are often associated with soot and particulate matter.

Three of the PAH compounds (naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene) monitored in this study are identified as primary components of Jet Propellant 5 (JP-5). The remaining 12 compounds are not associated with JP-5 but are associated with petroleum products such as gasoline and diesel fuels. **Testing for PAH at the NAHS began in January 2022, and no PAHs have been detected in the NAHS raw water since this time, or in post-treatment samples during this study.**

1.4 TREATMENT TECHNOLOGY

The treatment system utilizes two technologies, GAC filtration and IX. GAC filtration is commonly used on a range of scales, from large industrial or municipal treatment works to whole-house water filters and is even used in most tabletop water filtration pitchers. The GAC media is made from burned raw organic

materials rich in carbon such as coconut shells, coal, or wood. GAC is a porous material with high internal surface area that filters water by the processes of both absorption (mechanical) and adsorption (chemical) that trap chemicals inside of, or on the surface of the carbon. GAC works well on longer-chain PFAS (six or more carbons) like perfluorooctanoic acid and perfluorooctanesulfonic acid (PFOS), but shorter-chain PFAS (fewer than six carbons) like perfluorobutanesulfonic acid (PFBS) and perfluorobutanoic acid (PFBA) do not adsorb as well. GAC is generally more effective at removing long-chain PFAS because these compounds tend to avoid water and have a stronger attraction to carbon media. IX resin utilizes natural or manufactured resins to selectively remove constituents of concern. Most commonly, the resins are made from polymer beads and remove PFAS through a variety of actions, primarily electrostatic and hydrophobic effects. Depending upon the water chemical components, the IX resin can be more effective at the removal of PFAS than GAC, serving as an additional measure of treatment. Short-chain PFAS are more soluble in water, making them more readily exchanged by the resin. GAC and IX resin are effective for removing all types of PFAS, each in their own way. They are both reliable and economical treatment technologies, which is why they are utilized in this pilot testing treatment system.

The treatment system at the NAHS consists of four individual trains, with each train having two GAC vessels assembled in a lead-lag configuration, followed by a final IX resin vessel. This results in a total of 12 vessels. The system is designed to remove PFAS, TPH, and PAHs. At peak flows (b) (3) (A) [redacted]), the treatment system is designed to operate with three trains running at a time with one redundant train out of service for maintenance. The NAHS Water Use Permit allows for an annual average flow rate of [redacted]. Train IV was utilized for the pilot test with a design flow rate of approximately (b) (3) (A) gallons per minute. The piping to and from the treatment system is National Sanitation Foundation (NSF)-certified, 24-inch Standard Dimension Ratio 11, high-density polyethylene piping. In support of this system, there are the three 9,000-gallon booster tanks and two associated pumps (primary and redundant) which will pump the treated post-GAC water into the JBPHH distribution system after chlorination and fluoridation. (Figure 1). Appendix B presents a process flow diagram of the GAC/IX treatment system and piping.

Figure 1: GAC/IX Treatment System Layout (CUI)

2. Monitoring Pilot Study Overview

2.1 OBJECTIVE

The primary objective of conducting the pilot study was to demonstrate the treatment system's efficacy in reducing PFAS concentrations (under conditions representative of standard operation) below the EPA's April 2024 NPDWR maximum contaminant levels (MCLs), which become enforceable in 2029 (Table 1). Future raw water PFAS concentrations are expected to be similar to those seen historically and during this pilot study. Only two PFAS compounds, PFOA and PFOS, have been detected above their respective MCLs in prior sampling of the NAHS. Demonstration of the efficacy of the treatment system with the pilot study is a requirement of the DOH's conditional approval to reactivate the NAHS (DOH 2025).

Table 1: Comparison of Results with 2029 EPA PFAS Standards

PFAS Constituent	2029 MCL	NAHS Prior to Pilot Study [a]			NAHS Pilot Study Pre-Treatment [b]			NAHS Pilot Study Post-IX Treatment [c]

[a] NAHS Prior to Pilot Study: Data collected from NAHS source (i.e., pre-chlorination) and the entry-point to the distribution system (i.e., post-chlorination) between April 18, 2023, and March 7, 2025.
[b] NAHS Pilot Study Pre-Treatment: Data collected from the raw water (i.e., pre-chlorination) sample location during the pilot study between April 8, 2025, and May 2, 2025.
[c] NAHS Pilot Study Post-IX Treatment: Data collected from the effluent (i.e., post-IX) sample location during the pilot study between April 8, 2025, and May 2, 2025.
[d] For non-detections, a value of zero was used when calculating the average concentration.
[e] ND denotes the analyte was not detected.
[f] The hazard index (HI) represents a running average of the combined concentrations of PFHxS, PFNA, HFPO-DA, and PFBS. For each sampling date and corresponding analysis, an individual HI was calculated, and these values were then averaged to determine the overall HI.

2.2 PILOT STUDY APPROACH AND METHODS OF SAMPLING

The monitoring required AECOM to closely coordinate the sampling schedule with JBPHH Utilities personnel and the treatment system operator to synchronize treatment system operation with the sample collection. Samples were collected during each activation period from NSF 61-certified spigots located prior to the GAC (raw water/influent), between the GAC and IX vessels (post-GAC), and directly after IX treatment (post-IX).

To evaluate each phase of the treatment process, representative samples were collected in the following order during each operational event from the following locations with example photos shown in Appendix A, Figure 3:

1. Prior to the GAC treatment (raw water/influent)
2. Between the GAC lag vessel and IX vessel (post-GAC)
3. After the IX vessel (post-IX)

The planned duration of the pilot study was 30 days. Water was flushed through Train IV of the treatment system for approximately 4 hours every 2 or 3 days. The NAHS was left inactive between flushes. However, on day 24 (May 2, 2025), the State of Hawaii Department of Transportation requested an emergency suspense to the pilot study's discharge operations to facilitate emergency repairs to downgrade infrastructure below the adjacent freeway. Accordingly, the Navy suspended further operations, which prevented the remaining 6 days of the pilot study, including the final two sampling events. After notification to and consultation with DOH, it was determined that sufficient samples had been collected to support the conclusion of the pilot study. Over the 24-day pilot study period, a total of 33 water samples were collected from the three locations (raw water, post-GAC, and post-IX) occurring every 2–3 days with one event per day. An additional three quality control samples were collected during the pilot study totaling 36 sample sets. DOH was invited to oversee sample collection activities and collect split samples for an independent check on accuracy. DOH did not collect any split samples. Email confirmation that DOH did not collect pilot study split samples is provided in Appendix F.

Generally, the startup of the filters is defined in an operations plan which includes disinfection of the treatment vessels, flooding of the GAC/IX tanks, rinsing fines off the media, and letting the tanks settle to remove the air trapped in the filter media. Initial sampling for turbidity, chlorides, sodium, and other parameters indicates that the first two sample collection events were influenced by the startup process and the IX process had not yet reached operational efficiency, meaning that the IX vessel did not reach peak anion removal capability.

Experienced sampling technicians collected raw water samples directly after shaft startup. Samples after GAC/IX treatment (effluent) were collected later in the event's operation cycle. To verify adequate system flushing at the raw water sample site, after the GAC vessels sample collection and the IX treatment sample collection, samplers recorded readings of pH, conductivity, turbidity, and temperature using a field-calibrated water quality meter. Once all four water quality parameters stabilized, the sample was collected for the analytical parameters discussed in Section 2.3. Steady-state water quality conditions were achieved when three consecutive readings collected at 5-minute intervals were within 10 percent of each other. A single free chlorine reading was also recorded prior to sample collection. Per the approved sampling and analysis plan, the analytes that were required to be at steady state were pH, conductivity, and temperature. If turbidity did not stabilize within 30 minutes, a sample was collected to ensure the operation timeframe was not exceeded.

Sampling locations are presented on the flow diagram of the treatment system provided in Appendix B. Collecting samples from these locations enabled calculation of removal efficiency for each phase of treatment and the overall effectiveness of the train at treating the water.

2.3 METHODS OF ANALYSIS

All samples were analyzed for PFAS via EPA Method 533: *Determination of Per- and Polyfluoroalkyl Substances in Drinking Water by Isotope Dilution Anion Exchange Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry* and EPA Method 537.1: *Determination of Selected Per- and Polyfluorinated Alkyl Substances in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS)* at (b) (4) [redacted]. A subset of PFAS compounds was analyzed by both methods. See Appendix C for a list of compounds analyzed by both methods.

The remaining analytical parameters measured are a subset of potential constituents of concern identified in the Extended Drinking Water Monitoring (EDWM) plan: TPH, volatile organic compounds (VOCs); semivolatile organic compounds, and PAHs. These analyses were all performed at (b) (4) [redacted]. Selected water quality parameters such as anions, cations, alkalinity, and total suspended solids were analyzed to monitor characteristics of the water as it passed

through various stages of treatment. A complete table of the analytical methods, analytes, detection limits, and reporting limits (RLs) is provided in Appendix D.

As outlined in the methods, the laboratory reports TPH concentrations based on the total combined signal of all chemical compounds that appear within a specific time range during testing, rather than measuring each compound individually. Because of this approach, the reported TPH values may include not only PHC but also other non-petroleum substances that happen to fall within that time range. As a result, additional evaluations and more detailed analyses are needed to accurately determine the actual composition and source of any detected TPH.

TPH was measured in samples using SW-846 Method 8015D, a gas chromatographic method. Chromatography is an analytical technique commonly used for separating a mixture of chemical substances into its individual components, so that concentrations of individual components can be measured. Samples are prepared in such a way that the constituents of concern are extracted from the sample and concentrated into a solvent so that they can be injected into the instrument—in this case, a gas chromatograph (GC). The GC is heated, and different chemicals will pass through the instrument at different times depending on their chemical properties such as boiling point and molecular weight. A chromatogram is the visual output that records the response (peak) as the different chemicals in a sample are separated over time. Each peak on the graph represents a different substance, and the size of the peak is representative of how much of that substance is present.

Because TPH includes hundreds of chemicals, it is impractical to measure each individual component. Therefore, TPH concentrations reported by the laboratory are based on the sum of all peaks falling within a specified period, rather than identifying and quantitating individual peaks. Therefore, results often include non-petroleum compounds. Additional evaluations and analyses are necessary to determine the true nature of any reported detections. In the event that TPH detections were reported in any of the pilot study samples, chromatograms were reviewed by an experienced chemist, (b) (4) performed further diagnostic tests (mass spectral searches), and the sample was submitted to (b) (4) for additional specialized analyses. (b) (4) analyzed the samples for a quantitative evaluation of PHC and potential indicators using the following analytical methods:

- SW-846 8260 D – Paraffins-Isoparaffins-Aromatics-Naphthenes-Olefins (PIANO)
- SW-846 8270E-SIM –Parent and Alkylated-PAHs (PAPAHs)
- SW-846 8015D – Saturated Hydrocarbons (SHCs)

These methods provide additional, more detailed information than is possible with the original analyses. For example, when evaluating TPH detections, the PIANO and SHC methods can identify and quantitate individual hydrocarbon concentrations (with RLs of approximately 1 microgram per liter [µg/L]) rather than reporting one result for an entire carbon range with an RL of 80 µg/L. An extended list of PAHs and their alkylated derivatives can be analyzed using the PAPAHs method, all at very low RLs, providing additional information that is key to determining the potential source of any detected analyte. Alkylated PAHs refers to a group of compounds that have the same base PAH structure but have one or more alkyl groups attached to it. An alkyl group is a molecule fragment consisting only of carbon and hydrogen atoms attached by single bonds.

3. Results

3.1 SUMMARY

Sample results demonstrate the effectiveness of the treatments system at removing PFAS. Results meet the updated 2029 NPDWR for PFAS as shown in Table 2. Eight PFAS compounds were detected in each of the raw water samples, and another six were detected occasionally (Table 2). In those instances where a particular

compound was analyzed by both Method 533 and Method 537.1, concentrations were higher in Method 533 results. Variations between the methods are expected. Method 533 is an isotope dilution method that corrects for extraction efficiency, which tends to lead to higher results.

There were no PFAS compounds detected in the post-GAC samples with the exception of a 1.5 ng/L detection of PFOS via Method 537.1 in the sample collected during the first event (April 8, 2025). PFOS was not detected in this sample via Method 533 and was not detected in any subsequent post-GAC samples. Since this sample was collected on the first day of the pilot study before system efficiency was achieved, it is likely associated with start-up issues or other conditions that would not be expected once the treatment system is fully operational. All post-IX samples were non-detect for all PFAS compounds. There were no PAH compounds detected in any samples collected for the pilot study.

The Navy's Aiea Halawa pilot study sampling included monitoring for chloride. Those results are presented more fully in Appendix C. Chlorides are an indicator of saltwater intrusion. The NAHS pumps from a narrow freshwater lens that floats on top of a saline water table beneath. Over-pumping the NAHS will draw in salt water. Based on the 2015 *Utility System Assessment of the JBPHH Potable Water System* by Engineering Concepts, Inc. (DON 2015), the 30201 Waimalu Aquifer System, from which the NAHS obtains its water, has a high chloride level. At the time of the 2015 report, the pumpage from the aquifer system exceeded the aquifer's sustainable yield by nearly 2 mgd. Due to the over pumpage, the freshwater lens, floating on the saline water, was thinning, exacerbating the issue of rising chloride levels.

In addition, the first two sampling events show lower chloride concentrations in the post-IX than in the raw water or at the post-GAC sampling location. This is attributed to startup issues as the IX process was activated. For the first two sampling events, chlorides are significantly reduced by the IX vessel, which is associated with both the start-up of the IX process and (it is assumed[1]) the resin's ion preferential selectivity. After the first two sampling events, the IX vessel has marginally discharged more chlorides than came into the vessel; this demonstrates that the resin is releasing chloride ions in exchange for a stronger anion in the raw water like bicarbonate, sulfate, PFAS, or nitrate. The anion exchange resin used at the NAHS is designed to remove negatively charged ions (anions) from the water, replacing them with chloride ions.

At the start of each sampling event, the crews monitored the turbidity in nephelometric turbidity units (NTUs) of the water at that sampling location (raw water, post-GAC, and post-IX). Monitoring turbidity using a flow through cell indicated when the turbidity stabilized. The high turbidity readings on the first day of sampling (April 8, 2025) was assumed to be caused by air bubble turbulence and flushing of fines at the startup of each sampling event. However, total suspended solids (TSS) were not detected in any pilot study samples (raw water, Post-GAC, or Post-IX). This demonstrates that fines were not an issue. The results of that monitoring are summarized in Appendix A, Section 5.2. With each sampling event, turbidity was monitored for 30 minutes with measurements recorded every 5 minutes. The program's turbidity limit was 5 nephelometric turbidity units.

On April 8, 2025 (the first day of monitoring), the post-GAC turbidity measurements were significantly above the turbidity limit of 5 NTU. Those values are shown in Appendix A.5, Section 5.2. The startup process was too short and did not allow adequate time for removal of the air from inside the GAC vessels prior to monitoring.

[1] Without detailed information on the resin's manufacture and product information this is an assumption.

Table 2: Summary of Results

Method Group	Analyte	EPA (MCL)	Raw water		Post-GAC [a]		Post-IX [a]

[a] Due to startup issues, initial sampling for turbidity, chlorides, sodium, and other parameters indicates that the first two sample collection events were influenced by the startup process and the IX process had not yet reached operational efficiency, meaning that IX vessel did not reach peak anion removal capability.

3.1.1 TPH Detections

TPH was not detected in any of the raw water or post-GAC samples during the pilot study. However, (b) (4) reported a TPH diesel range organics (TPH-d) concentration of 886 µg/L in the post-IX sample collected on April 8, 2025. TPH has been detected in all post-IX samples with successively decreasing concentrations through the eighth sampling event on April 25, 2025, after which the concentration began to plateau at approximately 150 µg/L.

When the first TPH detection was noted, information was solicited from the treatment system operator to understand potential causes for the detections. The resin contains polystyrene beads that are held together by divinyl benzene cross-linkers; the TPH-d detections are the result of initial contact of the water with the IX resin. Additional evaluation is warranted, and the Navy has inquired with the manufacturer about the resin and will follow up with DOH once results are obtained.

The chromatogram of the initial post-IX sample contained a series of peaks appearing in approximately the same range where C10-C18 n-alkanes would be seen. The same pattern was seen in all subsequent post-IX samples. Chromatographic overlays (Appendix G) of the first seven sampling events show identical patterns appearing at the same time that are decreasing in size for each successive sample. This demonstrates that the unknown constituents contributing to the TPH detections are consistent. Visual evaluation of the peak pattern, including overlays with chromatograms from JP-5 and diesel fuel, indicates that the detected substance is not fuel-related. Furthermore, a detailed review of laboratory method blanks, chromatograms, and mass spectral confirmation did not detect any of the alkanes expected to be present in petroleum compounds. This evaluation was unable to positively identify any of the compounds responsible for the peaks as there were no strong spectral matches with any of the compounds in the National Institute of Standards and Technology (NIST) library. While the identity remains unknown, the available information rules out a petrogenic source for the detections.

All post-IX samples were sent to (b) (4) for additional specialized analyses (PIANO, PAPAHs, and SHC). The key findings of these analyses are that the same chromatographic patterns are observed, the constituents are non-petrogenic, the identity of the constituents is unknown, and the C9-C44 petroleum hydrocarbon results from each sampling event closely match the total TPH results obtained by (b) (4).

Table 3 presents a summary of the detected results for each of the analyses, summarizing the number of detections of each analyte and providing the maximum and minimum concentrations for each. In addition to the tracking of C9-C44 petroleum hydrocarbon results with the (b) (4) TPH-d results, two additional items are significant. First, petrogenic hydrocarbon mixtures are composed predominantly of saturated hydrocarbons – molecules containing only carbon and hydrogen joined by single bonds. Only eight of the 12 samples contained measurable concentrations of saturated hydrocarbons, and these made up less than five percent of the reported C9-C44 petroleum hydrocarbons.

Second, styrene was detected in the PIANO analysis of the post-IX samples from the first six sampling events at decreasing concentrations, and the IX-resin contains polystyrene beads. Polystyrene is a polymer created from styrene monomers. The finished resin would be expected to contain residual styrene monomer fragments that would be flushed from the system over time. The presence of styrene and its gradual reduction to non-detect levels adds evidence to the assertion that resin components are being flushed from the treatment system and detected in the post-IX water.

To summarize, there were no TPH detections in the raw water or post-GAC samples during the pilot study. However, TPH-d was detected in the post-IX samples. The TPH-d detections in the post-IX samples are not fuel-related. Additional evaluations of these results are warranted.

4. Conclusions

4.1 SUMMARY ASSESSMENT

All post-IX samples were non-detect for all PFAS compounds. The results demonstrate that the GAC is successfully removing both long- and short-chain PFAS from the water and the resin is successfully removing any residual. The low-level detection of PFOS from the first day of the sampling at the post-GAC location is due to issues with system startup, which is supported by the chloride and turbidity results discussed in Section 3.1.

There was no TPH present in the raw water at the NAHS for this pilot study nor any raw water sample collected by the Navy since January 2022. Historical NAHS sampling data are provided in Appendix H. There is no compelling evidence to suggest that the NAHS was impacted by the November 2021 JP-5 fuel release at Red Hill. The TPH detections present in the post-IX are not due to the presence of petroleum compounds and did not originate in the water from the NAHS. The most compelling evidence that the post-IX detections are not related to JBPHH activities is that there were no TPH detections in the raw water or post-GAC samples, meaning that they could not have originated in the water from the NAHS. This fact, combined with the information from the resin manufacturer, points to resin artifacts as the source of the TPH detections. Additional evaluation of the post-IX TPH results is recommended. The IX resin manufacturer is currently conducting studies to determine the source and identity of compounds and will provide the results of this study in a supplemental report.

The pilot study results indicate that the removal efficiency of PFAS is in compliance with EPA's future NPDWR at each post-treatment phase. The data support the Navy's request to reactivate the NAHS in compliance with EPA and DOH requirements.

Appendix A:
Detailed Discussion of NAHS Reactivation Pilot Study

Appendix A.1

1. Introduction

1.1 PURPOSE OF THE PILOT STUDY

This technical memorandum (TM) presents the findings from the pilot study of the granular activated carbon (GAC) and ion exchange (IX) treatment system at the United States Department of the Navy's (Navy's) Aiea-Halawa Shaft (NAHS) in Aiea, Hawaii. As one part of the reactivation plan (DON 2024), the study aims to support the Navy's goal of reactivating the NAHS to enhance the resiliency and redundancy of the Joint Base Pearl Harbor-Hickam (JBPHH) public water system (PWS), which serves approximately 93,000 residents, private consumers, critical Department of Defense (DoD) industrial processes, building heating, ventilation and cooling systems, and critical emergency response and firefighting services in southern Oahu. It is a community water system as defined by Title 40 Code of Federal Regulations, Part 141, Subpart A and, prior to November 2021, was supplied by three groundwater wells, namely the Waiawa, Red Hill, and Navy Aiea-Halawa shafts.

The pilot study was designed to evaluate the effectiveness of the treatment system in removing per- and polyfluoroalkyl substances (PFAS), as well as address constituents of concern, including total petroleum hydrocarbons (TPH) and polycyclic aromatic hydrocarbons (PAH), from the water supply at NAHS under conditions representative of standard operation. The study's results will inform the Navy in their request to reactivate the NAHS in compliance with the United States Environmental Protection Agency (EPA) and State of Hawaii Department of Health (DOH) regulations. The Navy was granted approval to reactivate the NAHS on February 7, 2025, under the condition of completion of the pilot study as well as other requirements (DOH 2025).

Neither TPH nor PAHs were detected in the raw water for the pilot study; thus, removal efficiency of these compounds could not be evaluated. However, GAC treatment is a proven and reliable method that is well known for its ability to adsorb organic compounds onto its surface, thereby removing them from water upon contact. Therefore, it is expected that this treatment system would effectively remove both TPH and PAHs if present in the source water.

The results of the pilot study as presented in this report support the Navy's request to reactivate NAHS in compliance with EPA and DOH requirements.

1.2 BACKGROUND

Although not affected by the Red Hill fuel release, the NAHS was isolated from the JBPHH public water supply on December 3, 2021, after the Red Hill Shaft was disconnected as an additional measure of caution by the Navy. Since then, the Waiawa Shaft remains the sole source of potable water for the entire JBPHH PWS. Since November 2020, analytical results of NAHS raw source water samples reported several PFAS compounds above the 2024 EPA NPDWR health advisory levels that become enforceable on April 26, 2029. The source of the PFAS compounds at NAHS is unknown. Since temporarily removing NAHS from service, the Navy proactively began pursuing a treatment system for the NAHS water supply to achieve compliance with evolving PFAS regulations. Reactivating NAHS is a vital Navy resiliency measure providing an alternative water source to supplement the Waiawa Shaft. In addition, demonstration of the efficacy of the treatment system with the pilot study is a requirement of the DOH's conditional approval to reactivate the NAHS (DOH 2025). The treatment system is designed to remove potential future impacts from sources including fuel-related compounds like TPH and PAH. In addition, the treatment system provided an opportunity to evaluate and document the chloride concentrations previously noted in the 2015 Utility System Assessment of the JBPHH Potable Water System by Engineering Concepts, Inc. (DON 2015).

1.3 DESCRIPTION OF PFAS, TPH, AND PAHS

PFAS are a collective name for a broad class of man-made chemicals of concern that have recently been in the spotlight due to potential human and environmental health risks. While public attention to PFAS is relatively new, the chemicals have been used globally since the 1940s. PFAS are considered emerging constituents of concern because research is ongoing to better understand the impacts they pose to human health, animal health, and the environment. Previous testing data at the NAHS have shown that several PFAS compounds are present at concentrations above NPDWR levels.

TPH is defined as the total amount of petroleum-based hydrocarbons measured in an environmental sample. Petroleum hydrocarbons (PHC) refer to a family of several hundred chemicals made up primarily of carbon and hydrogen atoms that originate from crude oil and are processed (or refined) to create mixtures used for fuel, tar, lubricants, and other substances. TPHs are common environmental contaminants found in soil, water, and air. A detection of TPH does not equate to the presence of fuel. Not all PHC originate from fuel and as discussed in detail in Section 2.3, the non-specific nature of the analytical method means that the reported concentration may have contributions from chemicals that are not PHC at all. Detections of TPH-d were reported in NAHS raw water samples collected from various sampling ports in December 2021. There was one additional low-level TPH-d detection reported in an EPA sample collected from the raw water in June 2024. A duplicate sample was collected by EPA and the TPH-d results were non-detect. Navy's split sample results were also non-detect for TPH. **Other than this sample, no TPH has been found in the NAHS raw water since Navy began collecting samples in January 2022.** All historical NAHS sample data is provided in Appendix H.

PAHs are a sub-class of PHC, and 15 of these compounds are analyzed in this study. PAHs are primarily introduced into the environment through two broad pathways: petrogenic and pyrogenic sources.

Petrogenic PAHs originate from geological processes that form fossil fuels and are common in petroleum products. In the environment, they may originate from point sources such as oil spills, petroleum handling facilities and asphalt pavements, or from more dispersed sources such as leaking oils or fuels from individual vehicles.

Pyrogenic PAHs are formed by the incomplete combustion of organic matter, including fossil fuels, wood, and biomass. Typical sources are from vehicle exhaust and wildfires and are often associated with soot and particulate matter.

Three of the PAH compounds (naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene) monitored for in this study are identified as primary components of Jet Propellant 5 (JP-5). The remaining 12 compounds are not associated with JP-5 but are associated with petroleum products such as gasoline and diesel fuels. **Testing for PAH at NAHS began in January 2022, and no PAH has been detected in the NAHS raw water since this time, or in post-treatment samples during this study.**

1.4 TREATMENT TECHNOLOGY

The treatment system utilizes two technologies, GAC filtration and IX. GAC filtration is commonly used at a range of scales, from large industrial or municipal treatment works to whole-house water filters and is even used in most tabletop water filtration pitchers. The GAC media is made from burned raw organic materials rich in carbon such as coconut shells, coal, or wood. GAC is a porous material with high internal surface area that filters water by the processes of both absorption (mechanical) and adsorption (chemical) that trap chemicals inside of, or on the surface of the carbon. GAC is highly effective at adsorption of longer-chain PFAS (six or more carbons) like perfluorooctanoic acid and perfluorooctanesulfonic acid (PFOS), but shorter-chain PFAS (fewer than six carbons) like perfluorobutanesulfonic acid (PFBS) and perfluorobutanoic acid (PFBA) do not adsorb as well. GAC is generally more effective at removing long-chain PFAS because these compounds tend to avoid water and have a stronger attraction to carbon media. IX resin utilizes natural or manufactured resins to selectively remove constituents of concern. Most commonly, the resins are made from polymer beads and remove PFAS through a variety of actions, primarily electrostatic and hydrophobic effects. Depending upon the water chemical components, the IX resin can be more effective at the removal of PFAS than GAC, serving as an additional measure of treatment. Short-chain PFAS are more soluble in water, making them more readily exchanged by the resin. GAC and IX resin are effective for removing all types of PFAS, each in their own way. They are both reliable and economical treatment technologies, which is why they are utilized in this pilot testing treatment system.

The treatment system at the NAHS consists of four individual trains (Figure 1), with each train having two GAC vessels assembled in a lead-lag configuration, followed by a final IX resin vessel. This results in a total of 12 contact tanks, eight GAC, and four IX vessels. The system is designed to remove potential TPH, PAHs, and PFAS constituents of concern. At peak flows ((b) (3) (A)), the treatment system is designed to operate with three trains running at a time with one redundant train out of service for maintenance. The NAHS Water Use Permit allows for an annual average flow rate of (b) (3) (A) . Train IV was utilized for the pilot test with a design flow rate of approximately (b) (3) (A) gallons per minute. The piping to and from the treatment system is National Sanitation Foundation (NSF)-certified, 24-inch Standard Dimension Ratio 11, high-density polyethylene piping. In support of this system, there are the three 9,000-gallon booster tanks and two associated pumps (primary and redundant) which will pump the treated water into the JBPHH distribution system after chlorination and fluoridation (Figure 2). Appendix B presents a process flow diagram of the GAC/IX treatment system and piping.

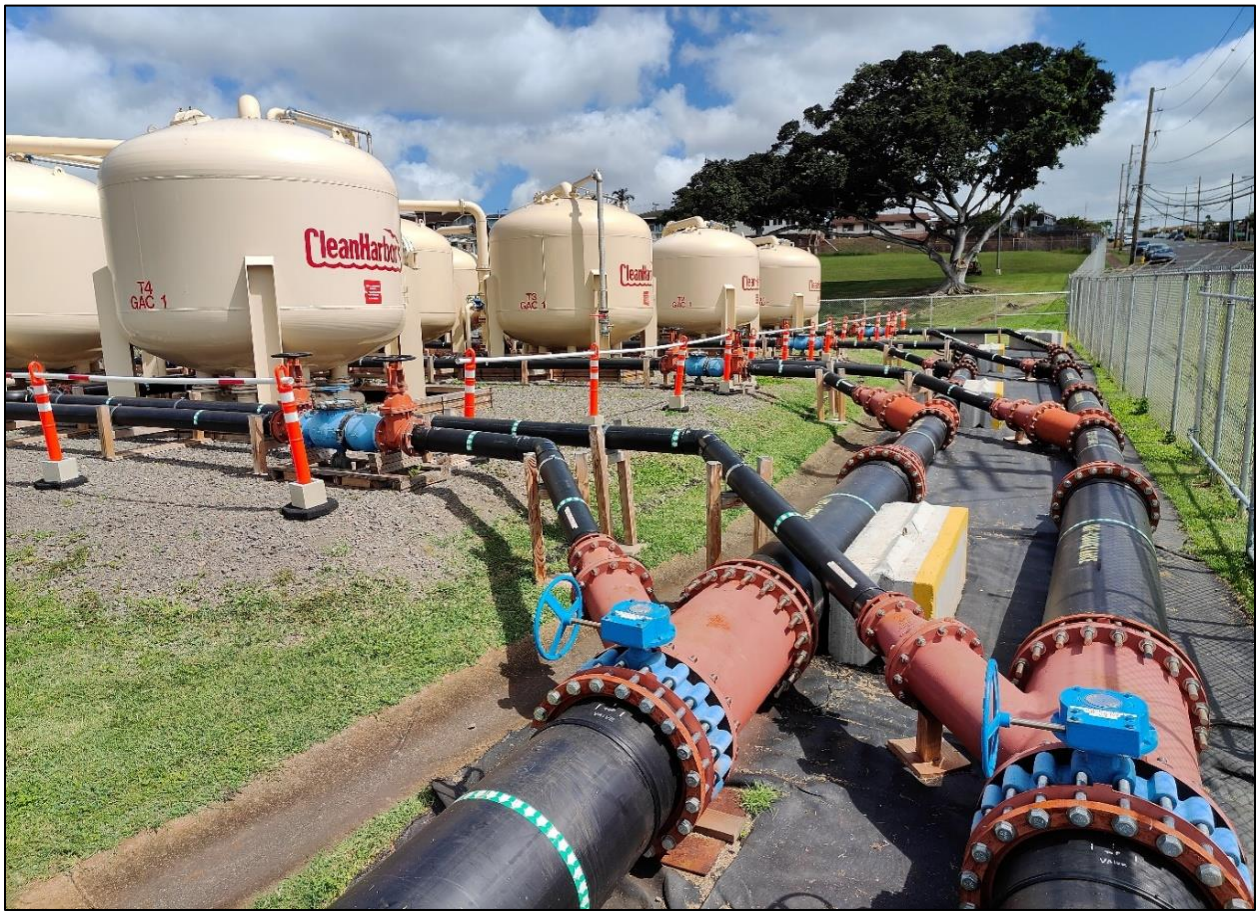

Figure 1: Clean Harbors, Inc. GAC/IX Treatment Trains at NAHS

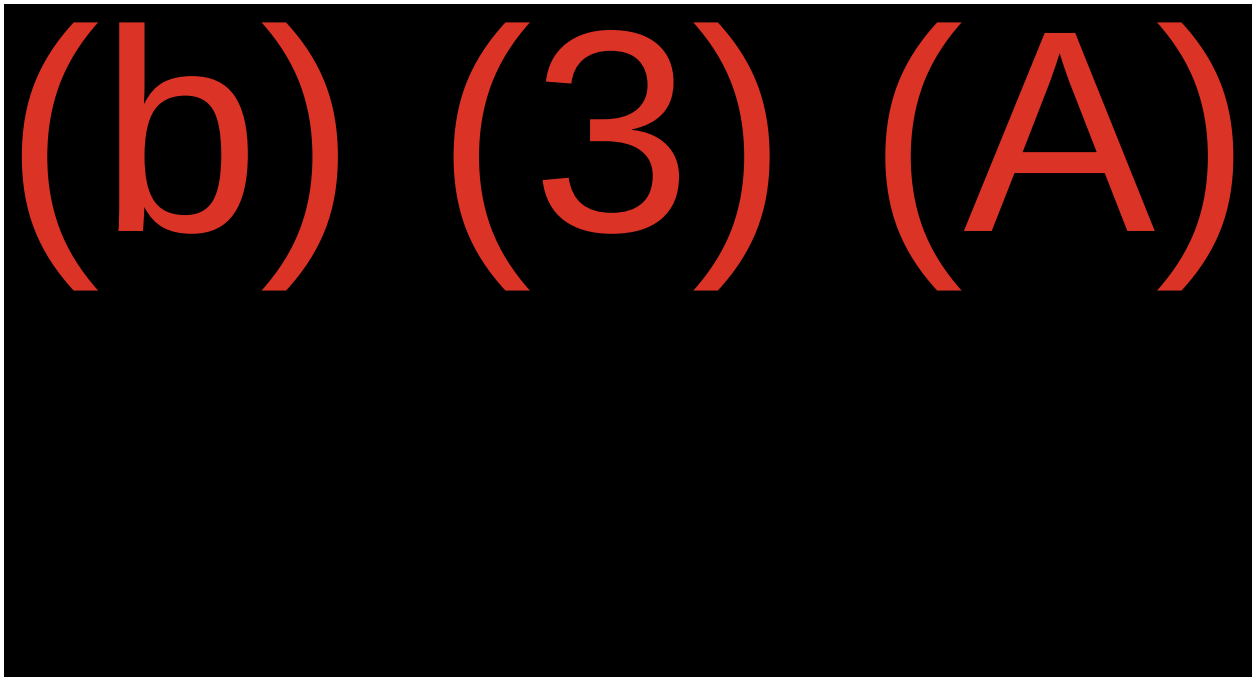

Figure 2: GAC and IX Treatment System Layout (CUI)

1.5 OVERVIEW OF THE GRANULAR ACTIVATED CARBON/ION EXCHANGE TREATMENT SYSTEM

The GAC and IX treatment system is (b) (3) (A) within Navy property on a leveled and accessible area adjacent to the Navy Halawa Housing Area.

Treatment system valving allows one, two, three, or all four trains to be operational, offering flexibility in adjusting the EBCT and servicing the vessels within the trains. The recommended EBCT to treat TPH is approximately 7.5 minutes at a maximum flow of approximately (b) (3) (A) per train. The EBCT for PFAS is 28–30 minutes for the GAC media. However, with the addition of the IX vessel, it reduces the EBCT for PFAS to 14–15 minutes. The combination of GAC media and IX resin will allow sufficient contact time to remove PFAS.

Spent GAC media shall be tested and disposed of at an on-island landfill if testing results comply with landfill disposal criteria. Spent IX resin shall be shipped off-island for proper disposal. Further information regarding the operation and maintenance of the treatment system will be provided in an updated NAHS Preventive Maintenance Plan submitted with the Navy's formal request to reactivate.

Materials, equipment, and configuration of the entire GAC/IX treatment system as well as the pilot study adhere to applicable potable water codes, regulations, and industry standards, which include the following:

- Safe Drinking Water Act of 1974, including its subsequent amendments
- Hawaii Administrative Rules, Title 11, Chapters 20, 25, and 30
- Unified Facilities Criteria 3-230-01 and 3-230-03
- NSF 60 – Drinking Water Treatment Chemicals – Health Effects
- NSF 61 – Drinking Water System Components
- American Water Works Association B604 – Granular Activated Carbon
- American Water Works Association standards

During the pilot study, the treatment system was operated under the supervision of a qualified and certified Grade 1 water treatment plant operator, provided by (b) (4). The treatment system operator coordinated with JBPHH Utilities personnel to synchronize NAHS pump activation with planned treatment system operational periods. During the pilot study, the Navy operated one of four treatment trains. The results of the single train are extrapolated to estimate treatment system efficacy under full operational conditions (i.e., flow through three of the four trains). The planned flow rate through the single train was approximately (b) (3) (A) for 4–6 hours every 2–3 days. The flow meter installed at the 1,654-foot mark on the influent line of the process flow diagram measured flows into the treatment system. Flow rates to the single train were adjusted to align with the planned flow rates under full NAHS and treatment system operation. Pumping frequency and flow rates were optimized to remain within well use extraction permit limits to reduce salinity intrusion concerns, maintain the integrity of the media, and reduce storage time.

To prevent backpressure to the NAHS pump while feeding the treatment system, the Navy released excess untreated groundwater through accessory outlets at the NAHS Pump Station to the grassy areas and the drainage swale that flows to Halawa Stream. After treatment, treated potable water was discharged through the treatment system flushing ports to a nearby drainage swale that connects to a Department of Transportation storm drainage culvert and channel directing flow to Halawa Stream.

The booster tanks/pumps and chlorination/fluoridation systems were not utilized during the pilot study phase and remain physically disconnected from the JBPHH PWS until DOH approves the NAHS reactivation.

Appendix A.2

2. Monitoring Pilot Study Overview

2.1 OBJECTIVES OF THE TECHNICAL MEMORANDUM

The primary objective of conducting the pilot study was to demonstrate the treatment system's efficacy in reducing PFAS concentrations (under conditions representative of standard operation) below the EPA's April 2024 NPDWR maximum contaminant levels (MCLs), which become enforceable in 2029 (Table 1). Future raw water PFAS concentrations are expected to be similar to those seen historically and during this pilot study. Only two PFAS compounds, PFOA and PFOS, have been detected above their respective MCLs in prior sampling of the NAHS. Demonstration of the efficacy of the treatment system with the pilot study is a requirement of the DOH's conditional approval to reactivate the NAHS (DOH 2025).

Table 1: Comparison of Results with 2029 EPA PFAS Standards

PFAS Constituent	2029 MCL	NAHS Prior to Pilot Study [a]			NAHS Pilot Study Pre-Treatment [b]			NAHS Pilot Study Post-IX Treatment [c]

[a] NAHS Prior to Pilot Study: Data collected from NAHS source (i.e., pre-chlorination) and the entry-point to the distribution system (i.e., post-chlorination) between April 18, 2023, and March 7, 2025.
[b] NAHS Pilot Study Pre-Treatment: Data collected from the raw water (i.e., pre-chlorination) sample location during the pilot study between April 8, 2025, and May 2, 2025.
[c] NAHS Pilot Study Post-IX Treatment: Data collected from the effluent (i.e., post-IX) sample location during the pilot study between April 8, 2025, and May 2, 2025.
[d] For non-detections, a value of zero was used when calculating the average concentration.
[e] ND denotes the analyte was not detected.
[f] The hazard index (HI) represents a running average of the combined concentrations of PFHxS, PFNA, HFPO-DA, and PFBS. For each sampling date and corresponding analysis, an individual HI was calculated, and these values were then averaged to determine the overall HI.

This TM provides documentation of the evaluation of analytical results that will be used in a subsequent report on the overall effectiveness of the treatment system on water chemistry and its efficacy at primarily reducing PFAS, TPH, and PAHs.

This TM provides supporting information to permit the Navy to optimize the treatment processes and/or flow rates to improve overall system efficacy.

2.2 PILOT STUDY APPROACH AND METHODS OF SAMPLING

The monitoring required AECOM to closely coordinate the sampling schedule with JBPHH Utilities personnel and the treatment system operator to synchronize treatment system operation with the sample collection. Samples were collected during each activation period from NSF 61-certified spigots located prior to the GAC (raw water/influent), between the GAC and IX vessels (post-GAC), and directly after IX treatment (post-IX).

To evaluate each phase of the treatment process, representative samples were collected in the following order during each operational event from the following locations with example photos shown on Figure 3:

1. Prior to the GAC treatment (raw water/influent)
2. Between the GAC lag vessel and IX vessel (post-GAC)
3. After the IX vessel (post-IX)

The planned duration of the pilot study was 30 days. Water was flushed through Train IV of the treatment system for approximately 4 hours every 2 or 3 days. The NAHS was left inactive between flushes. However, on day 24 (May 2, 2025), the State of Hawaii Department of Transportation requested an emergency suspense to the pilot study's discharge operations to facilitate emergency repairs to downgrade infrastructure below the adjacent freeway. Accordingly, the Navy suspended further operations, which prevented the remaining 6 days of the pilot study, including the final two sampling events. After notification to and consultation with DOH, it was determined that sufficient samples had been collected to support the conclusion of the pilot study. Over the 24-day pilot study period, a total of 33 water samples were collected from the three locations (raw water, post-GAC, and post-IX). These samples were collected over 11 sampling events occurring every 2–3 days with one event per day. An additional three quality control samples were collected during the pilot study totaling 36 sample sets in all. Additional quality control samples were collected, and DOH was invited to oversee sample collection activities and collect split samples for an independent check on accuracy. DOH did not collect any split samples. Email confirmation that DOH did not collect pilot study split samples is provided in Appendix F.

Generally, the startup of the filters is defined in an operations plan which includes disinfection of the treatment vessels, flooding of the GAC/IX tanks, rinsing fines off the media, and letting the tanks settle to remove the air trapped in the filter media. Initial sampling for turbidity, chlorides, sodium, and other parameters indicates that the first two sample collection events were influenced by the startup process and the IX process had not yet reached operational efficiency, meaning that the IX vessel did not reach peak anion removal capability.

Experienced sampling technicians collected raw water samples directly after shaft startup. Samples after GAC/IX treatment (effluent) were collected later in the event's operation cycle. To verify adequate system flushing at the raw water sample site, after the GAC vessels sample collection and the IX treatment sample collection, samplers recorded readings of pH, conductivity, turbidity, and temperature using a field-calibrated water quality meter. Once all four water quality parameters stabilized, the sample was collected for the analytical parameters discussed in Section 2.3. Steady-state water quality conditions were achieved when three consecutive readings collected at 5-minute intervals were within 10 percent of each other. A single free chlorine reading was also recorded prior to sample collection. Per the approved sampling and analysis plan, the analytes that were required to be at steady state were pH, conductivity, and temperature. If turbidity did not stabilize within 30 minutes, a sample was collected to ensure the operation timeframe was not exceeded.

Sampling locations are presented on the flow diagram of the treatment system provided in Appendix B. Collecting samples from these locations enabled calculation of removal efficiency for each phase of treatment and the overall effectiveness of the train at treating the water.

Figure 3: Sampling Location for prior to the GAC (left photo), post-GAC (middle photo) and post-IX (right photo). The red circles show the port used for sample collection.

At each of the three sampling locations, experienced sampling technicians utilized calibrated field instruments to measure and record temperature, pH, free chlorine, conductivity, and turbidity. Samples requiring shipment to a DOH- or EPA-certified laboratory for analyses were collected in appropriately preserved containers and promptly shipped in coolers following chain of custody protocol.

In addition to the field-testing parameters, Appendix C lists the analytes selected for analyses by a certified DOH/EPA laboratory. The certified laboratory provided coolers with the sample containers and preservatives required to collect the samples. Appendix D identifies for each parameter the analytical method, container type, preservation method, and holding times as required by state and federal drinking water regulations. The chain of custody documentation was maintained for samples during all phases of sample collection, transport, receipt, and internal transfer within the laboratory.

Field blank, trip blank, matrix spike/matrix spike duplicate, and field duplicate samples were included for additional quality control purposes during each sampling event. Turnaround time for analytical data from the laboratory occurred within 1 month of sample collection. Validated analytical results are included in Appendix E.

Prior to initiating field work, a pilot study kick-off meeting was held on April 8, 2025, by JBPHH Utilities, AECOM, and (b) (4) personnel to review safety concerns, equipment operation, and worker responsibilities. Field activities took place during normal daylight working hours. No field activities occurred on Saturdays or Sundays. Work was performed in Level D personal protective equipment, consisting of hard hats, safety glasses, safety-toed boots, and hearing protection. Samplers did not don clothing and personal hygiene products that may contain PFAS (e.g., sunblock, lotion, deodorant) to avoid the potential of cross-contamination to samples.

AECOM sampling technicians were trained in the intricacies of collecting samples for PFAS analyses. Field notes captured on notebook paper/forms were transitioned to electronic devices each day. Paper and pens were also PFAS Free, per AECOM's Standard Operating Procedures. Figure 4 shows an example of the field staff collecting the post-GAC and post-IX samples.

Figure 4: Post-GAC and Post-IX Sample Collection

Within one week in advance of testing, the Navy provided DOH with a tentative schedule for the anticipated 30-day pilot study sampling schedule giving DOH an opportunity to be present to observe and collect split samples with the consultant, if desired. DOH did not opt to collect split samples during the pilot study. In addition, due to an unforeseen issue, the pilot study concluded after 24 days.

Minimal investigation-derived waste from the pilot study was generated. The investigation derived waste from sampling was returned to AECOM's operation center for proper disposition.

Injection of chlorine and fluoride was not included in the pilot study.

The piping from the treatment system effluent flushing ports to the booster tanks/pump was not required for the pilot study since the treated water was discharged to a storm drain directly after testing.

2.3 METHODS OF ANALYSIS

All samples were analyzed for PFAS via EPA Method 533: *Determination of Per- and Polyfluoroalkyl Substances in Drinking Water by Isotope Dilution Anion Exchange Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry* and EPA Method 537.1: *Determination of Selected Per- and Polyfluorinated Alkyl Substances in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry* (LC/MS/MS) at (b) (4) [redacted]. A subset of PFAS compounds was analyzed by both methods. See Appendix C for a list of compounds analyzed by both methods.

The remaining analytical parameters measured are a subset of potential constituents of concern identified in the Extended Drinking Water Monitoring (EDWM) plan: TPH, volatile organic compounds (VOCs); semivolatile organic compounds, and PAHs. These analyses were all performed at (b) (4) [redacted]. Selected water quality parameters such as anions, cations, alkalinity, and total suspended solids were analyzed to monitor characteristics of the water as it passed through various stages of treatment. A complete table of the analytical methods, analytes, detection limits, and reporting limits (RLs) is provided in Appendix D.

As outlined in the methods, the laboratory reports TPH concentrations based on the total combined signal of all chemical compounds that appear within a specific time range during testing, rather than measuring each compound individually. Because of this approach, the reported TPH values may include not only PHC but also other non-petroleum substances that happen to fall within that time range. As a result, additional evaluations and more detailed analyses are needed to accurately determine the actual composition and source of any detected TPH.

TPH was measured in samples using SW-846 Method 8015D, a gas chromatographic method. Chromatography is an analytical technique commonly used for separating a mixture of chemical substances into its individual components, so that concentrations of individual components can be measured. Samples are prepared in such a way that the constituents of concern are extracted from the sample and concentrated into a solvent so that they can be injected into the instrument—in this case, a gas chromatograph (GC). The GC is heated, and different chemicals will pass through the instrument at different times depending on their chemical properties such as boiling point and molecular weight. A chromatogram is the visual output that records the response (peak) as the different chemicals in a sample are separated over time. Each peak on the graph represents a different substance, and the size of the peak is representative of how much of that substance is present.

Because TPH includes hundreds of chemicals, it is impractical to measure each individual component. Therefore, as stipulated in the methods, TPH concentrations reported by the laboratory are based on the aggregate integrated area sum of all peaks falling within a specified period, rather than identifying and quantitating individual peaks. Therefore, results often include non-petroleum compounds. Additional evaluations and analyses are necessary to determine the true nature of any reported detections. In the event that TPH detections were reported in any of the pilot study samples, chromatograms were reviewed by an experienced chemist, (b) (4) [redacted] performed further diagnostic tests (mass spectral searches), and the sample was submitted to (b) (4) [redacted] for additional specialized analyses. (b) (4) [redacted] analyzed the samples for a quantitative evaluation of PHC and potential indicators using the following analytical methods:

- SW-846 8260 D – Paraffins-Isoparaffins-Aromatics-Naphthenes-Olefins (PIANO)
- SW-846 8270E-SIM –Parent and Alkylated-PAHs (PAPAHs)
- SW-846 8015D – Saturated Hydrocarbons (SHCs)

These methods provide additional, more detailed information than is possible with the original analyses. For example, when evaluating TPH detections, the PIANO and SHC methods can identify and quantitate individual hydrocarbon concentrations (with RLs of approximately 1 microgram per liter [µg/L]) rather than reporting one result for an entire carbon range with an RL of 80 µg/L. An extended list of PAHs and their alkylated derivatives can be analyzed using the PAPAHs method, all at very low RLs, providing additional information that is key to determining the potential source of any detected analyte. Alkylated PAHs refers to a group of compounds that have the same base PAH structure but have one or more alkyl groups attached to it. An alkyl group is a molecule fragment consisting only of carbon and hydrogen atoms attached by single bonds.

Appendix A.3

3. Results and Interpretation

3.1 SUMMARY ASSESSMENT

All samples were analyzed for per- and polyfluoroalkyl substances via EPA Method 533: *Determination of Per- and Polyfluoroalkyl Substances in Drinking Water by Isotope Dilution Anion Exchange Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry* and EPA Method 537.1: *Determination of Selected Per- and Polyfluorinated Alkyl Substances in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS)* at (b) (4) [redacted] A subset of compounds was analyzed by both methods. Table 2 summarizes the PFAS compounds and the methods used to analyze them.

Table 2: PFAS Compounds and Analysis Methods

CAS	Analyte	Method 533	Method 537.1

CAS Chemical Abstracts Service

Sample results demonstrate the effectiveness of the treatments system at removing PFAS. Results meet updated 2029 NPDWR for PFAS as shown in Table 2. Eight PFAS compounds were detected in each of the raw water samples, and another six were detected occasionally (Table 3). In those instances where a particular compound was analyzed by both Method 533 and Method 537.1, concentrations were higher in Method 533 results. Variations between the methods are expected. Method 533 is an isotope dilution method that corrects for extraction efficiency, which tends to lead to higher results.

There were no PFAS compounds detected in the post-GAC samples with the exception of a 1.5 ng/L detection of PFOS via Method 537.1 in the first (April 8, 2025) sample. PFOS was not detected in this sample via Method 533 and was not detected in any subsequent post-GAC samples. Since this sample was collected on the first day of the pilot study before system efficiency was achieved, it is likely associated with start-up issues or other conditions that would not be expected once the treatment system is fully operational. All post-IX samples were non-detect for all PFAS compounds. The PFAS results, along with their respective 2029 NPDWR MCLs, are presented on Figure 5 to Figure 13 below. There were no PAH compounds detected in any samples collected for the pilot study.

The use of GAC is recognized as a common and effective method of remediation of contaminated water and soil. It is effective at removing petroleum from water by trapping oil molecules in its porous structure.

The Navy's Aiea Halawa pilot study sampling included monitoring for chloride. Those results are presented more fully in Appendix C. Chlorides are an indicator of saltwater intrusion. The NAHS pumps from a narrow freshwater lens that floats on top of a saline water table beneath. Over pumping the NAHS will draw in salt water. Based on the 2015 Utility System Assessment of the JBPHH Potable Water System by Engineering Concepts, Inc. (DON 2015), the 30201 Waimalu Aquifer System, from which the NAHS obtains its water, has a high chloride level. At the time of the 2015 report, the pumpage from the aquifer system exceeded the aquifer's sustainable yield by nearly 2 mgd. Due to the over pumpage, the freshwater lens, floating on the saline water, was thinning, exacerbating the issue of rising chloride levels.

In addition, the first two sampling events show lower chloride concentrations in the post-IX than in the raw water or at the post-GAC sampling location. This is attributed to startup issues as the IX process was activated. For the first two sampling events, chlorides are significantly reduced by the IX vessel, which is associated with the start-up of the IX process. After the first two sampling events, the IX vessel has marginally discharged more chlorides than came into the vessel; this demonstrates that the resin is releasing chloride ions in exchange for a stronger anion in the raw water like bicarbonate, sulfate, PFAS, or nitrate. The anion exchange resin used at NAHS is designed to remove negatively charged ions (anions) from the water, replacing them with chloride ions.

At the start of each sampling event, the crews monitored the turbidity in nephelometric turbidity units (NTUs)of the water at that sampling location (raw water, post-GAC, and post-IX). Monitoring turbidity using a flow through cell indicated when the turbidity stabilized. The high turbidity readings on the first day of sampling (08 April 2025) was assumed to be caused by air bubble turbulence and flushing of fines

at the startup of each sampling event. However, total suspended solids (TSS) were not detected in any pilot study samples (raw water, Post-GAC, or Post-IX). This demonstrates that fines were not an issue. The results of that monitoring are summarized in Section 5.2. With each sampling event, turbidity was monitored for 30 minutes with measurements recorded every 5 minutes. The program's turbidity limit was 5 nephelometric turbidity units.

On April 8, 2025 (the first day of monitoring), the post-GAC turbidity measurements were significantly above the turbidity limit of 5 NTU. Those values are shown in Section 5.2. The startup process was too short and did not allow adequate time for removal of the air from inside the GAC vessels prior to monitoring.

[a] Due to startup issues, initial sampling for turbidity, chlorides, sodium, and other parameters indicates that the first two sample collection events were influenced by the startup process and the IX process had not yet reached operational efficiency, meaning that IX vessel did not reach peak anion removal capability.

3.1.1 TPH DETECTIONS

TPH was not detected in any of the raw water or post-GAC samples for this pilot study. However, (b) (4) reported a TPH diesel range organics (TPH-d) concentration of 886 µg/L in the post-IX sample collected on April 8, 2025. TPH has been detected in all post-IX samples with successively decreasing concentrations through the eighth sampling event on April 25, 2025, after which the concentration began to plateau at approximately 150 µg/L.

When the first TPH detection was noted, information was solicited from the treatment system operator to understand potential causes for the detections. The resin contains polystyrene beads that are held together by divinyl benzene cross-linkers; the TPH-d detections are the result of initial contact of the water with the IX resin. Additional evaluation is warranted, and the Navy has inquired with the manufacturer about the resin and will follow up with DOH once results are obtained.

The chromatogram of the initial post-IX sample contained a series of peaks appearing in approximately the same range where C10-C18 n-alkanes would be seen. The same pattern was seen in all subsequent post-IX samples. Chromatographic overlays (Appendix G) of the first seven sampling events show identical patterns appearing at the same time that are decreasing in size for each successive sample. This demonstrates that the unknown constituents contributing to the TPH detections are consistent. Visual evaluation of the peak pattern, including overlays with chromatograms from JP-5 and diesel fuel, indicates that the detected substance is not fuel-related. Furthermore, a detailed review of laboratory method blanks, chromatograms, and mass spectral confirmation did not detect any of the alkanes expected to be present in petroleum compounds. This evaluation was unable to positively identify any of the compounds responsible for the peaks as there were no strong spectral matches with any of the compounds in the National Institute of Standards and Technology (NIST) library. While the identity remains unknown, the available information rules out a petrogenic source for the detections.

All post-IX samples were sent to (b) (4) for additional specialized analyses (PIANO, PAPAHs, and SHC). The key findings of these analyses are that the same chromatographic patterns are observed, the constituents are non-petrogenic, the identity of the constituents is unknown, and the C9-C44 petroleum hydrocarbon results from each sampling event closely match the total TPH results obtained by (b) (4) .

Table 4 presents a summary of the detected results for each of the analyses, summarizing the number of detections of each analyte and providing the maximum and minimum concentrations for each. In addition to the tracking of C9-C44 petroleum hydrocarbon results with the (b) (4) TPH-d results, two additional items are significant. First, petrogenic hydrocarbon mixtures are composed predominantly of saturated hydrocarbons – molecules containing only carbon and hydrogen joined by single bonds. Only eight of the 12 samples contained measurable concentrations of saturated hydrocarbons, and these made up less than five percent of the reported C9-C44 petroleum hydrocarbons.

Second, styrene was detected in the PIANO analysis of the post-IX samples from the first six sampling events at decreasing concentrations, and the IX-resin contains polystyrene beads. Polystyrene is a polymer created from styrene monomers. The finished resin would be expected to contain residual styrene monomer fragments that would be flushed from the system over time. The presence of styrene and its gradual reduction to non-detect levels adds evidence to the assertion that resin components are being flushed from the treatment system and detected in the post-IX water.

To summarize, there were no TPH detections in the raw water or post-GAC samples for this pilot study. However, TPH-d was detected in the post-IX samples. The TPH-d detections in the post-IX samples are not fuel-related. Additional evaluations of these results are warranted.

TPH is measured in JBPHH drinking water by integrating the entire area on a chromatogram, including all discrete peaks and the unresolved complex mixtures down to the baseline. The peaks must fall within a specific retention time windows, which is determined by the analysis of individual straight chain hydrocarbons (molecules containing only hydrogen and carbon arranged in a straight line with no double bonds) with a known number of carbon atoms. For example, n-pentane contains five carbon atoms and 12 hydrogen atoms and would be known as a C5 n-alkane. Three categories of TPH are measured in all JBPHH drinking water samples.

- *Gasoline Range Organics (TPH-g):* This measurement is defined as the total area of all peaks and the unresolved complex mixtures that come out (elute) between the observed retention times of C5 and C12 n-alkanes.
  - This range would include lighter fuels such as gasoline and individual chemical compounds such as benzene, toluene, ethyl benzene, and xylenes (BTEX).
- *Diesel Range Organics (TPH-d):* This measurement is defined as the total area of all peaks and the unresolved complex mixtures eluting between the observed retention times of C10 and C24 n-alkanes.
  - This range would include fuels such as diesel fuel and kerosene, and individual components such as naphthalene. JP-5 falls within this category with greater than 99% of its hydrocarbon mass eluting between C9 and C16 n-alkanes. It is important to understand that this range includes many compounds other than JP-5 and the result should not be interpreted as evidence of JP-5 contamination. Additional qualitative and quantitative assessment is required to make that determination.
- *Oil Range Organics (TPH-o):* This measurement is defined as the total area of all peaks and the unresolved complex mixtures eluting between the observed retention times of C24 and C40 n-alkanes.
  - Hydrocarbons eluting in this range are less likely to be fuel related as they have higher boiling points than the other ranges and are more often associated with lubricants and other greases.

All samples were sent to (b) (4) for analysis of TPH via EPA SW-846 Method 8015D for total petroleum hydrocarbons diesel range organics (TPH-d) and total petroleum hydrocarbons oil range organics (TPH-o), and via EPA SW-846 Method 8260 for total petroleum hydrocarbons gasoline range organics (TPH-g). Total TPH is calculated as the sum of TPH-d, TPH-o, and TPH-g. Concentrations for each of these ranges is obtained by integrating the entire area above the baseline between the retention times established by the analysis of straight chain saturated hydrocarbons (SHCs) of known carbon length. The specific ranges are not prescribed by the method but are established by the project. JBPHH drinking water ranges have been defined as C5-C12 for TPH-g, C9-24 for TPH-d, and >C24-C40 for TPH-o.

TPH was not detected in any of the raw water or post-GAC samples but was detected in all post-IX samples for this pilot study. It is well established that TPH detections do not necessarily equate to detections of petroleum compounds. The post-IX sample extracts were further evaluated using a detailed review of laboratory method blanks, chromatograms, and mass spectral confirmation outlined in the extended drinking water monitoring plan (DON et al. 2024). The procedure entails analyzing the sample extracts obtained from the original extraction using full scan gas chromatography-mass spectrometry via Method 8270. The purpose of this analysis is to compare the mass spectra of the individual peaks with the spectra of known petroleum constituents.

In addition, the post-IX samples were sent to (b) (4) and analyzed for additional specialized analyses (PIANO, PAPAHs, and SHC) identified in the extended drinking water monitoring plan (DON et al. 2024), specifically paraffins, isoparaffins, aromatics, naphthenes, and olefins (PIANO) volatile organics by SW-846 Method 8260D, parent and alkylated PAHs by SW-846 Method 8270E with selected ion monitoring, and SHCs by SW-846 Method 8015D (modified). The PIANO analysis yielded detections of styrene that have since fallen below detectable levels. Various aromatic hydrocarbons were detected at concentrations less than 0.1 µg/L in the parent and alkylated PAH analysis. Several straight chain and branched SHCs were detected in the SHC analysis of each of the post-IX samples at low or sub-µg/L concentrations with total saturated hydrocarbon detections ranging from approximately 0.1 µg/L to 28.4 µg/L. The SHC analysis also generates a total hydrocarbon concentration based on integrating the entire area between the retention times for C9 and C44 straight chain alkanes. This is a slightly larger range than the combined TPH-d and TPH-o ranges measured by (b) (4) but is considered useful for comparison of data. Figure 14 below plots the concentrations of TPH reported by (b) (4) and the C9-C44 petroleum concentrations reported by (b) (4). Figure 15 below plots the concentrations of styrene reported by (b) (4).

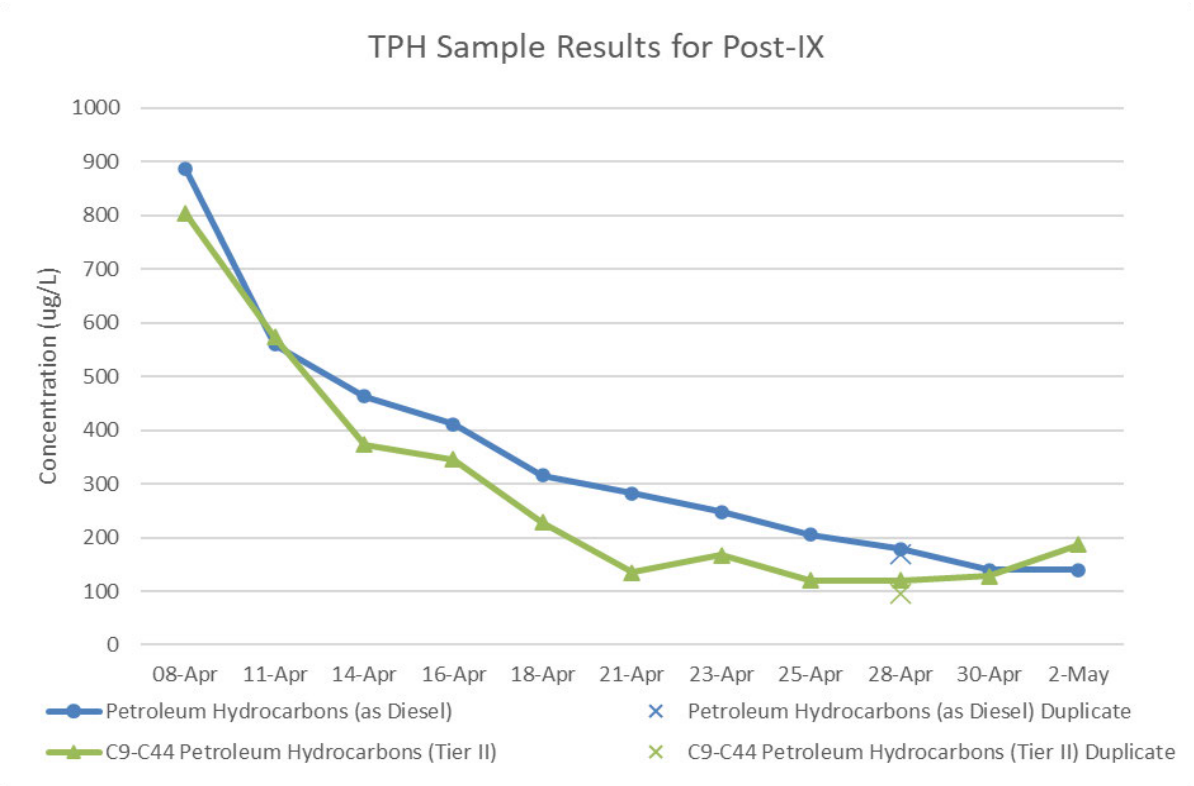

Figure 14: TPH Sample Results for Post-IX

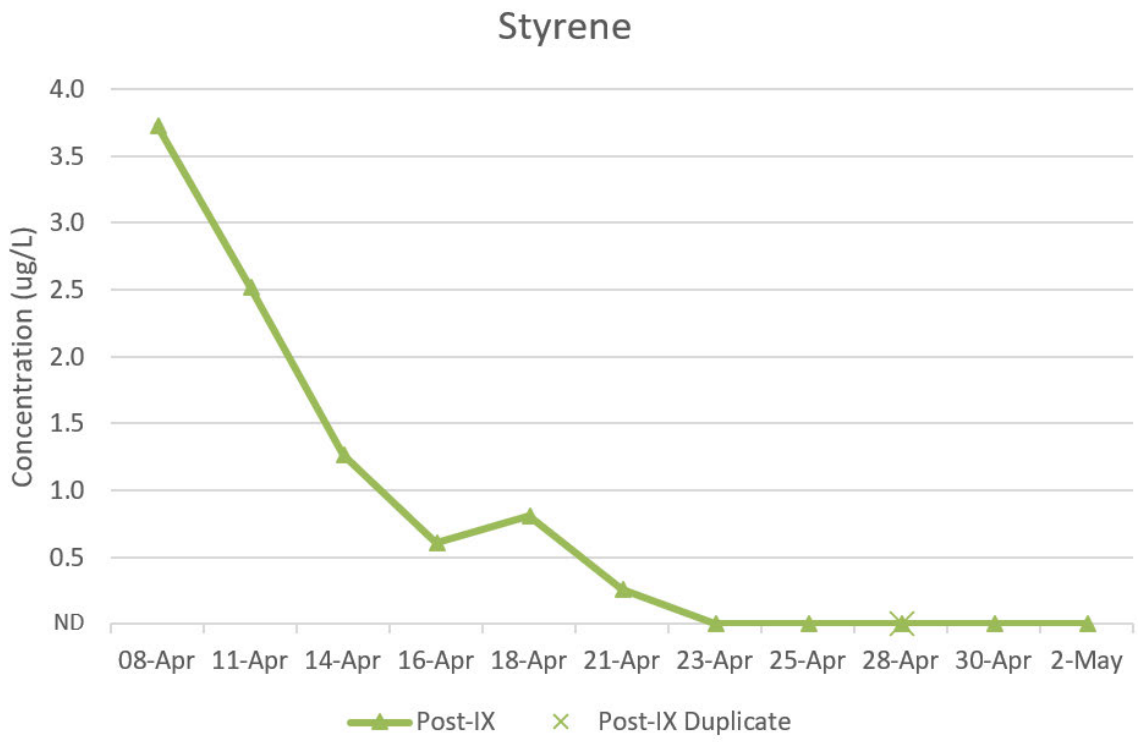

Figure 15: Styrene Sample Results for Post-IX

3.2 INTERPRETATION OF DATA

Eight PFAS compounds were detected in the raw water samples. There was a trace level detection of PFOS via Method 537.1 in the post-GAC sample collected on April 8, but the remaining post-GAC samples and all post-IX samples were non-detect for all PFAS compounds. These results suggest that the GAC is successfully removing PFAS from the water and the resin is successfully removing any residual.

In those instances where a compound was reported by both Methods 533 and 537.1, the results were similar although the Method 537.1 results tended to be slightly lower.

Due to a laboratory QC issue, non-detect results for hexafluoropropylene oxide dimer acid (HFPO-DA) analyzed by Method 533 were rejected in the post-GAC and post-IX samples collected on April 16, 2025. This compound is also analyzed by Method 537.1 and all results were non-detect. There have been no detections of HFPO-DA during the pilot study.

Due to a laboratory QC issue, non-detect results for perfluorotetradecanoic acid (PFTeDA) by Method 537.1 were rejected in the post-GAC sample collected on April 23, 2025. PFTeDA does not have an MCL and there have been no detections of this compound during the pilot study. This does not have an impact on the pilot study results.

TPH was not detected in any of the raw water or post-GAC samples. However, (b) (4) reported a diesel range organics (TPH-d) concentration of 886 µg/L in the post-IX sample collected on April 8, 2025. TPH has been detected in all post-IX samples at successively decreasing concentrations, with the concentration in the May 2, 2025 sample reported as 140 µg/L.

The chromatogram of the initial effluent contained a series of peaks eluting in approximately the C10-C18 n-alkane range. The same pattern was seen in all subsequent post-IX samples. Visual evaluation of the peak pattern, including overlays with chromatograms from Jet Fuel Propellant (JP)-5 and diesel fuel, indicate that the detected substance is not fuel related. Furthermore, a detailed review of laboratory method blanks, chromatograms, and mass spectral confirmation did not detect any of the alkanes expected to be present in petroleum compounds. This evaluation was unable to positively identify any of the compounds responsible for the peaks as there were no strong spectral matches with any of the compounds in the National Institute of Standards and Technology library. Because the resin constituents are proprietary, identification of the unknown compounds contributing to the TPH detections is not possible with the analytical methods utilized in this pilot study. The (b) (4) results from additional specialized analyses (PIANO, PAPAHs, and SHC) of the post-IX samples have not identified a petrogenic source for the detections. The (b) (4) C9-C44 petroleum hydrocarbon results from each sampling event closely match the total TPH results obtained by (b) (4).

Communication with the treatment system operator indicated that the resin contains polystyrene beads that are held together by divinyl benzene cross-linkers. The supplier believes that the detections are the result of initial contact of the water with the resin dissolving the polystyrene substrate and that these artifacts will approach zero over time. It is worth noting that styrene was detected in the PIANO analyses for each of the post-IX samples, which is consistent with contact with polystyrene beads. The styrene concentrations have fallen below detectable levels.

There are detectable concentrations of other unknown chemicals, which have also diminished over the course of the pilot study. Based on discussion with the operations team, it is anticipated that remaining residual compounds will be flushed out over time. However, additional flushing and testing is recommended to identify unidentified compounds and demonstrate all compounds are flushed. Because the resin constituents are proprietary, identification of the unknown compounds contributing to the TPH detections is not possible with the analytical methods utilized in this pilot study. While there are no exceedances of existing or proposed MCLs for the tested analytes, additional evaluation is recommended.

All available evidence indicates that the TPH detections are not due to the presence of petroleum compounds and did not originate in the water from NAHS. The most compelling evidence that these detections are not related to JBPHH activities is that there were no TPH detections in the influent or post GAC- samples, meaning that they could not have originated in the water from NAHS. This fact, combined with the information from the resin manufacturer, points to resin artifacts as the source of the TPH detections.

Appendix A.4

4. Comparison with Standards

4.1 COMPLIANCE WITH 2029 EPA ENFORCEABLE MAXIMUM CONTAMINANT LEVEL CRITERIA FOR PFAS

The EPA has established enforceable MCLs for specific PFAS chemicals in drinking water as part of its NPDWR for PFAS. The enforceable MCL criteria include:

- Individual MCLs
  - *Perfluorooctanoic acid and PFOS:* An enforceable MCL of 4.0 parts per trillion (ppt) has been set individually for each of these PFAS.
  - Perfluorononanoic acid (PFNA), perfluorohexanesulfonic acid (PFHxS), and GenX Chemicals: An enforceable MCL of 10 ppt has been set individually for each of these PFAS.
- MCL for PFAS Mixtures
  - *Hazard Index (HI) of 1:* An HI of 1 has been established as an MCL for mixtures of two or more of the following PFAS: PFNA, PFHxS, GenX chemicals, and PFBS. The HI is calculated by summing the hazard quotients (HQs) of regulated PFAS components. Each HQ is determined by dividing the measured concentration of PFAS in water by its Health-Based Water Concentration (HBWC). This means that when these PFAS are present together, their combined levels must not exceed an HI of 1.
  - HQs are a key part of the EPA's approach to regulating PFAS mixtures in drinking water. An HQ is the ratio of the measured concentration of PFAS in drinking water to its HBWC. The HBWC is the level below which no adverse health effects are expected over a lifetime of exposure. The HI is the sum of the HQs for the regulated PFAS components. If the HI exceeds 1, it indicates an exceedance of the MCL. The EPA's rules specifically target mixtures of PFHxS, PFNA, hexafluoropropylene oxide dimer acid (GenX), and PFBS. Each of these has its own HBWC, and their combined HQs contribute to the overall HI.

    The HQ for each regulated PFAS component is calculated using the formula:

$$HQ = \frac{Measured\ Concentration}{HBWC}$$

    The HBWCs for the regulated PFAS components are as follows:

    - *PFHxS:* 10 ppt
    - *PFNA:* 10 ppt
    - *Hexafluoropropylene Oxide Dimer Acid (GenX):* 10 ppt
    - *PFBS:* 2,000 ppt

    These HBWCs are the levels below which no adverse health effects are expected over a lifetime of exposure.

    For example, if the measured concentration of PFHxS in water is 5 ppt and its HBWC is 10 ppt, the HQ would be 0.512.

In 2025, compliance with the current EPA PFAS rule includes that PWSs are required to monitor for these PFAS. Compliance is determined by calculating a running annual average of PFAS levels at sampling points. If the running annual average exceeds the MCL for any of the listed PFAS or the HI, the system is considered in violation. Public notification will be required for PWSs exceeding MCLs, and the systems must take steps to reduce PFAS levels.

The EPA's MCLs for PFAS in drinking water become fully enforceable for PWSs in April 2029. A breakdown of the key dates is as follows:

- *Initial Monitoring (2024–2027):* PWSs need to complete initial monitoring for the regulated PFAS.
- *Reporting and Ongoing Monitoring (2027–2029):* Water systems will publish initial monitoring results and start regular compliance monitoring, publishing results annually.
- *Full Enforcement (2029):* PFAS MCL compliance becomes fully enforceable. Public notice will be required for any MCL violations, and quarterly monitoring continues.

In summary, while the current EPA PFAS rule itself goes into effect sooner, water systems have until April 2029 to implement any necessary solutions to reduce PFAS levels and achieve compliance with the MCLs.

Appendix A.5

5. Additional Evaluations

5.1 CHLORIDE LEVEL TRENDS AND SALINITY INTRUSION CONCERNS

In November 2013, the Commission on Water Resource Management's Deep Well Program (CWRM 2025) described Hawaii's aquifers by saying:

> *Hawaii's unique volcanic geology provides for large aquifers (water bearing rock) that are able to support the State's population by supplying potable ground water as well as water for agricultural and other purposes. These aquifers are replenished by rainfall. Because fresh ground water is slightly less dense than seawater, it floats on top of the saline water forming what is known as a Ghyben-Herzberg lens, which is referred to as a "basal" aquifer. Theoretically, for every foot of fresh water above sea level, there is 40 feet of fresh water below sea level. Between the freshwater and salt-water portions of the lens is a zone of mixing, known as the "Transition Zone."*
>
> *In Hawaii, the chloride ion concentration (milligrams per liter or mg/L) is used to determine the freshness or saltiness of ground water. It is also listed as a contaminant in the EPA Secondary Drinking Water Regulations. Chloride in small concentrations is not harmful to humans, but in concentrations above 250 mg/L, or 2 percent that of seawater, it imparts a salty taste in water that is objectionable to many people. By definition, the Transition Zone is water greater than 250 mg/L chloride (TTZ) to the mid-point concentration of 9,500 mg/L chloride (MPTZ), which is 50 percent of seawater. Below the mid-point, concentration increases to sea water at 19,000 mg/L chloride. Because the amount of water that can be developed from a freshwater lens for potable use is constrained by the salinity of the water, the altitude of the top of the transition zone (where chloride concentration is 2 percent that of seawater) and the thickness of the transition zone are important. The transition zone is in constant flux, responding to changes caused by variations in pumping and rainfall.*

The 2015 Utility System Assessment of the JBPHH Potable Water System by Engineering Concepts, Inc. (DON 2015), listed findings for the Halawa Water Pumping Station related to condition, reliability, and integrity of the potable water source. It stated that based on discussions with Hawaii Department of Land and Natural Resources, the 30201 Waimalu Aquifer System, from which the NAHS obtains its water, has a high chloride level. At the time of the report, the pumpage from the aquifer system exceeded the aquifer's sustainable yield by nearly 2 mgd. Due to the over pumpage, the freshwater lens, floating on the saline water, was thinning, exacerbating the issue of rising chloride levels.

The 2007 Oceanit Townscape, Inc. *Central Oahu Watershed Study, Final Report* (BWS 2007), for the Honolulu Board of Water Supply, stated that "Drought and increased pumping will increase chloride levels and reduce the thickness of the freshwater lens."

The Commission of Water Resource Management maintains the Halawa Deep Monitoring Well (3-2253-003) and provides details of the fluctuations in the water table, the fresh water lens, the brackish water transition zone, and the sea water in the area (CWRM 2025). This information is shown on Figure 16.

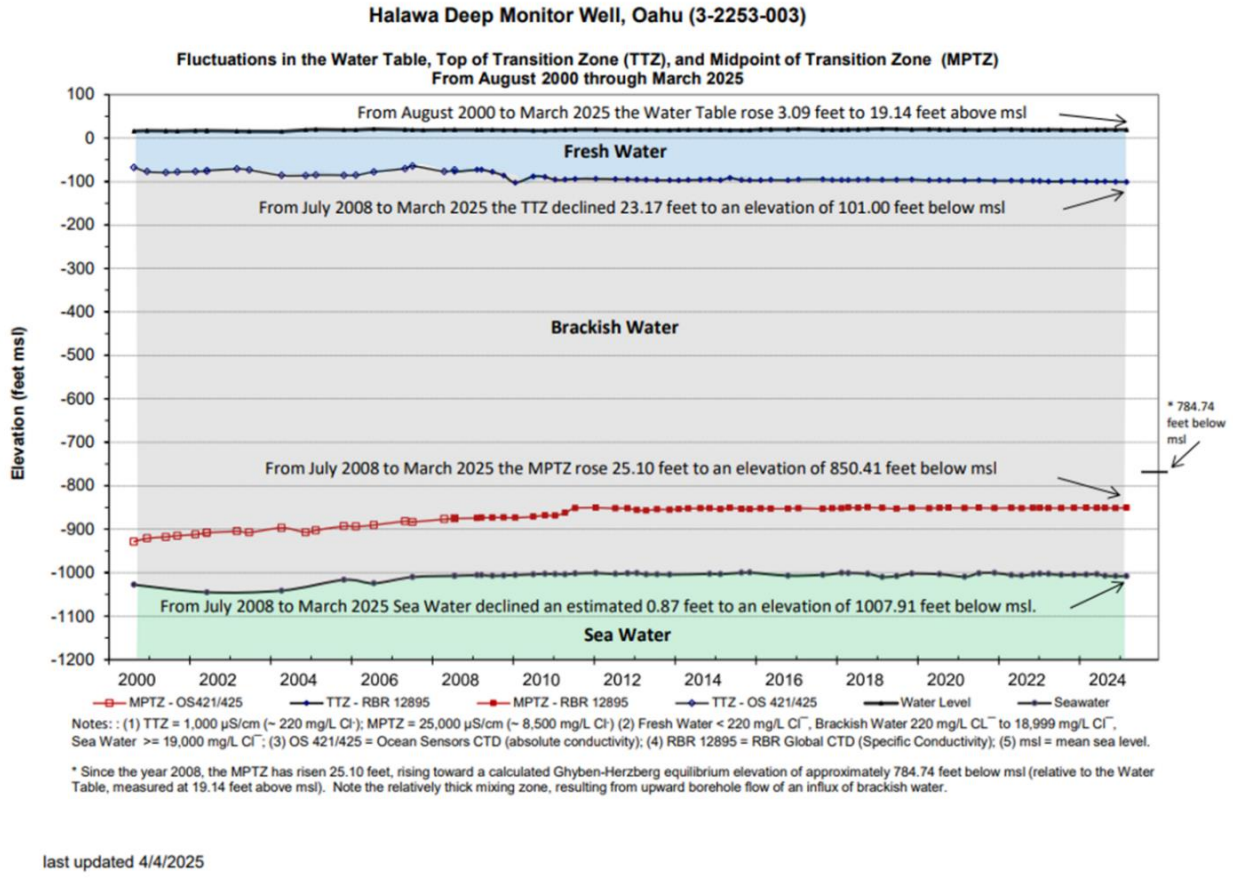

Figure 16: Halawa Deep Monitor Well Fluctuation Data from August 2000 to March 2025

The Navy's Aiea Halawa pilot study sampling included monitoring for chloride. Those results are presented more fully in Appendix E but are summarized below on Figure 17. The first two sample events show lower chloride concentrations in the post-IX samples than in the raw water or at the post-GAC sample location. This could be attributed to startup issues as the IX process was activated. After the first two sample events, the IX vessel has marginally more chlorides coming off than coming into the vessel; this would indicate that the resin is releasing chloride ions in exchange for a stronger anion in the influent water like bicarbonate, sulfate, PFAS, or nitrate. This indicates that the IX process uses an anion exchange resin. Anion exchange resins are designed to remove negatively charged ions (anions) from the water, replacing them with chloride ions.

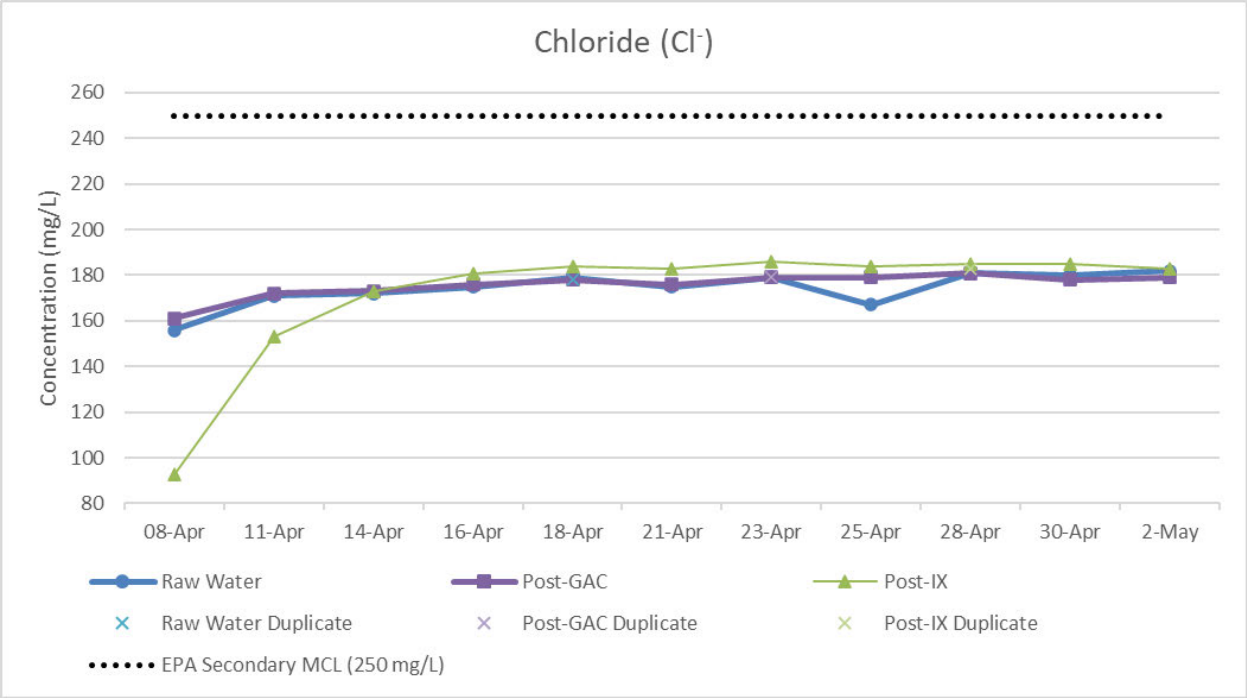

Figure 17: Chloride (Cl^-) Concentrations During Navy's Aiea Halawa Pilot Study

5.2 TURBIDITY

At the start of each sampling event, the crews monitored the turbidity of the water at that sampling location (raw water, post-GAC, and post-IX). Monitoring turbidity using a flow through cell indicated when the turbidity stabilized. The turbidity was assumed to be caused by air bubble turbulence at the startup of each sampling event. The results of that monitoring are summarized on Figure 18 through Figure 23 below. With each sampling event, turbidity was monitored for 30 minutes with measurements recorded every 5 minutes. The program's turbidity limit was 5 nephelometric turbidity units (NTUs).

On April 8, 2025, (the first day of monitoring) the post-GAC turbidity measurements were significantly above the turbidity limit of 5 NTU. The turbidity measurements are shown separately on Figure 19 to avoid scaling issues. The turbidity measurements demonstrate that the startup process was too short and did not allow adequate time for removal of the air and fines from inside of the GAC vessels prior to monitoring. This assertion is supported by the change in chloride concentrations over the first three sampling events.

5.3 TOTAL SUSPENDED SOLIDS

There were no detections for total suspended solids at any of the sampling points over the sampling period.

5.4 INORGANICS

The sampling results for inorganic analysis are summarized in Figure 24 through Figure 36.

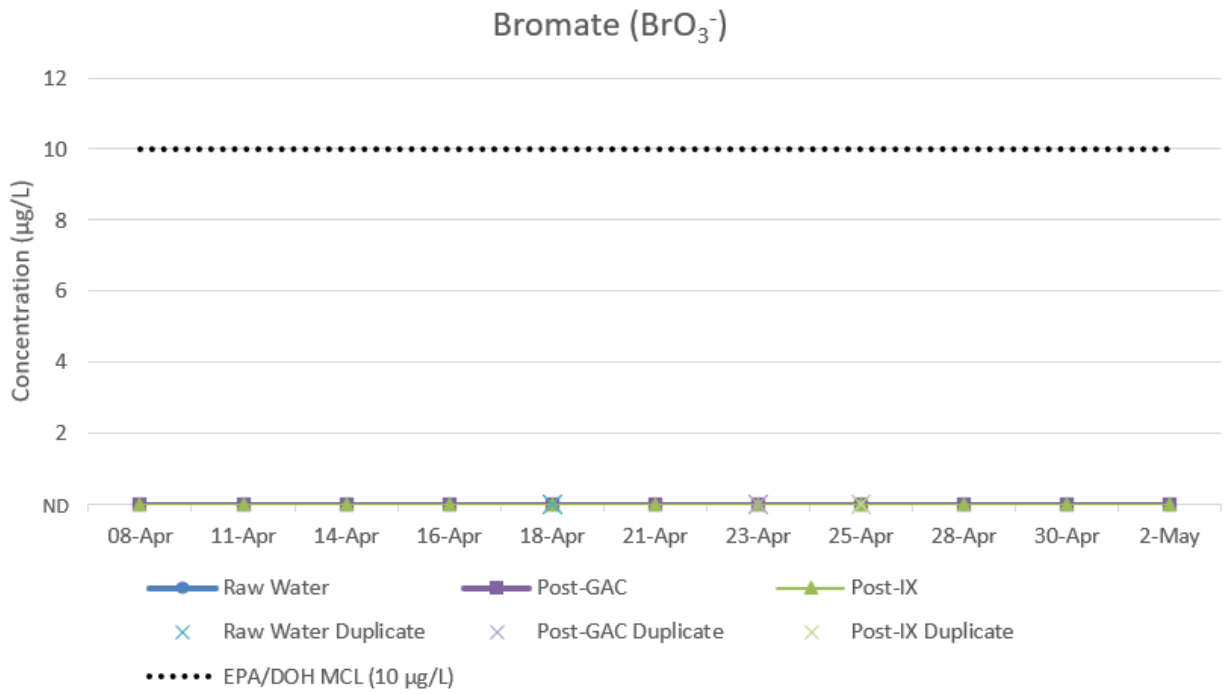

Figure 24: Bromate (BrO_3^-) Concentrations

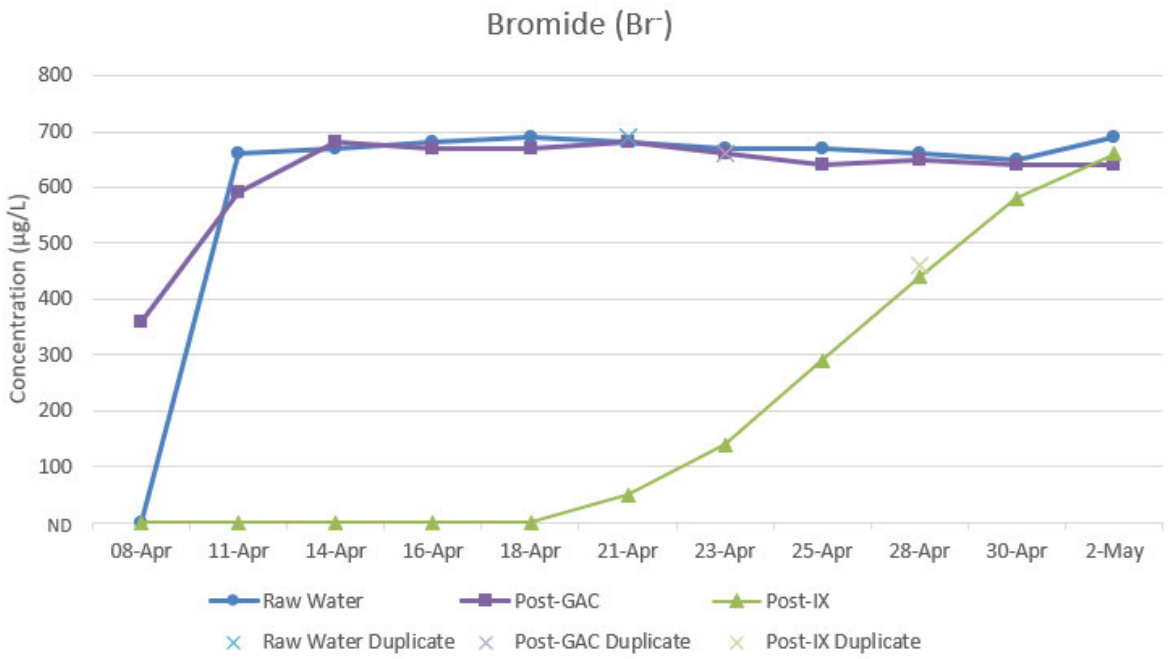

Figure 25: Bromide (Br^-) Concentrations - The removal of bromide decreased over the course of pilot study. Initially bromide was removed to non-detectable levels. Breakthrough began to occur on 18 April 2025. By the end of the pilot study on 02 May 2025, it appears that bromide was no longer being removed. This observation is due to the selective affinity of the resin, which encourages the exchange of targeted anions and diminishes the exchange of non-target anions. The exact selective affinity for specific anions is assumed to be proprietary by the resin manufacturer.

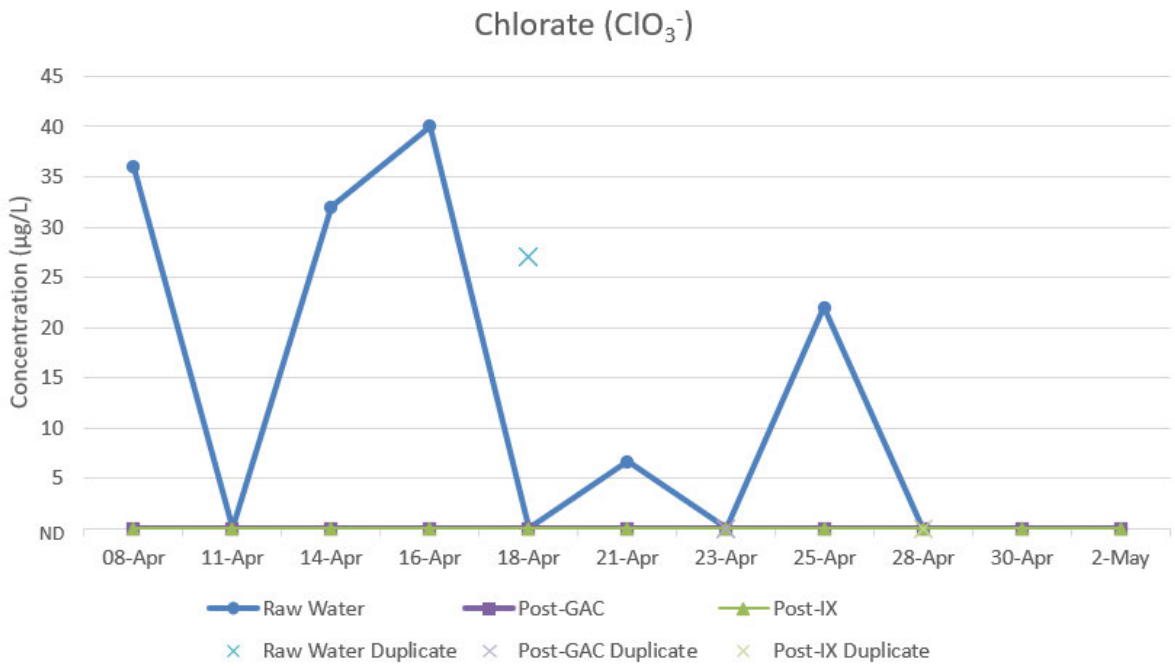

Figure 26: Chlorate (ClO_3^-) Concentrations

Appendix A.6

6. Conclusion

6.1 SUMMARY OF FINDINGS

All post-IX samples were non-detect for all PFAS compounds. The results demonstrate that the GAC is successfully removing both long and short-chain PFAS from the water and the resin is successfully removing any residual. The low-level detection of PFOS from the first day of the sampling at the post-GAC location is due to issues with system startup, which is supported by the chloride and turbidity results discussed in Section 3.1.

In those instances where a compound was reported by both Methods 533 and 537.1, the results were similar, although the Method 537.1 results tended to be slightly lower. Inherent differences in the quantitation procedures for the two methods account for this tendency.

There have been no TPH detections reported in raw water samples from NAHS collected by the Navy during this study, or since January 2022. Historical NAHS sampling data is provided in Appendix H. There is no compelling evidence to suggest that the NAHS was impacted by the November 2021 JP-5 fuel release at Red Hill. The TPH detections present in the post-IX are not due to the presence of petroleum compounds and did not originate in the water from NAHS. The most compelling evidence that the post-IX detections are not related to JBPHH activities is that there were no TPH detections in the raw water or post-GAC samples, meaning that they could not have originated in the water from NAHS. This fact, combined with the information from the resin manufacturer, points to resin artifacts as the source of the TPH detections. Additional evaluation of the post-IX TPH results is recommended. The IX resin manufacturer is currently conducting studies to determine the source and identity of compounds and will provide the results of this study in a supplemental report.

The pilot study results indicate that the removal efficiency of PFAS is in compliance with EPA's future NPDWR at each post-treatment phase. The data support the Navy's request to reactivate NAHS in compliance with EPA and DOH requirements.

Notes:
All samples will be chilled to < 6°C, unless otherwise noted.
EPA Method 8015 is not a drinking water method and is typically run on unchlorinated water samples. However, the JBPHH drinking water samples are chlorinated. Therefore, samples will be quenched with sodium thiosulfate prior to sample collection to stop reactions from occurring between chlorine, potential analytes, and reagents added to the sample by the laboratory. This is done for drinking water analyses (e.g., drinking water methods 524.2 and 525.2).

Summary of Chemistry Results
Shaft
Drinking Water Sampling, Joint Base Pearl Harbor - Hickam, Oahu, Hawaii

Notes:
ND = Not Detected
ISP = Incident Specific Parameter
EAL = DOH Environmental Action Level
EPA MCL = EPA Maximum Contaminant Level
All Results shown in Parts per Billion (ppb), with the exception of Field and Bacterial Test results
Parts per Million (ppm)
Parts per Thousand (ppth)
§ - Exceeds Screening Level
-- = No Information Available
N (Normal) = Full compliance sample
FD (Field Duplicate) = Extra sample taken for quality control
N (Grab, Resample) = Additional follow-up sample
MPN/mL = Most probable number per milliliter

Summary of Chemistry Results
Shaft
Drinking Water Sampling, Joint Base Pearl Harbor - Hickam, Oahu, Hawaii

Notes:
ND = Not Detected
ISP = Incident Specific Parameter
EAL = DOH Environmental Action Level
EPA MCL = EPA Maximum Contaminant Level
All Results shown in Parts per Billion (ppb), with the exception of Field and Bacterial Test results
Parts per Million (ppm)
Parts per Thousand (ppth)
§ - Exceeds Screening Level
-- = No Information Available
N (Normal) = Full compliance sample
FD (Field Duplicate) = Extra sample taken for quality control
N (Grab, Resample) = Additional follow-up sample
MPN/mL = Most probable number per milliliter

Summary of Chemistry Results
Zone Shaft
Drinking Water Sampling, Joint Base Pearl Harbor - Hickam, Oahu, Hawaii

Notes:
ND = Not Detected
ISP = Incident Specific Parameter
EAL = DOH Environmental Action Level
EPA MCL = EPA Maximum Contaminant Level
All Results shown in Parts per Billion (ppb), with the exception of Field and Bacterial Test results
Parts per Million (ppm)
Parts per Thousand (ppth)
§ - Exceeds Screening Level
-- = No Information Available
N (Normal) = Full compliance sample
FD (Field Duplicate) = Extra sample taken for quality control
N (Grab, Resample) = Additional follow-up sample
MPN/mL = Most probable number per milliliter

Summary of Chemistry Results
PFAS Sampling, Red Hill, JBPHH

Notes:
ND = Not Detected
PPT = Parts per Trillion
PPB = Parts per Billion
PPM = Parts per Million
§ - Exceeds Screening Level
-- = No Information Available
N (Normal) = Full compliance sample
FD (Field Duplicate) = Extra sample taken for quality control
N (Grab, Resample) = Additional follow-up sample
Results are screened to the November 2023 EPA RSLs in accordance with Update to Assistant Secretary of Defense for Energy, Installations, and Environment Memorandum, "Investigating Per- and Polyfluoroalkyl Substances within the Department of Defense Cleanup Program" dated August 24, 2023.

Summary of Chemistry Results
PFAS Sampling, Red Hill, JBPHH

Notes:
ND = Not Detected
PPT = Parts per Trillion
PPB = Parts per Billion
PPM = Parts per Million
§ - Exceeds Screening Level
-- = No Information Available
N (Normal) = Full compliance sample
FD (Field Duplicate) = Extra sample taken for quality control
N (Grab, Resample) = Additional follow-up sample
Results are screened to the November 2023 EPA RSLs in accordance with Update to Assistant Secretary of Defense for Energy, Installations, and Environment Memorandum, "Investigating Per- and Polyfluoroalkyl Substances within the Department of Defense Cleanup Program" dated August 24, 2023.

Summary of Chemistry Results
PFAS Sampling, Red Hill, JBPHH

Notes:
ND = Not Detected
PPT = Parts per Trillion
PPB = Parts per Billion
PPM = Parts per Million
§ - Exceeds Screening Level
-- = No Information Available
N (Normal) = Full compliance sample
FD (Field Duplicate) = Extra sample taken for quality control
N (Grab, Resample) = Additional follow-up sample
Results are screened to the November 2023 EPA RSLs in accordance with Update to Assistant Secretary of Defense for Energy, Installations, and Environment Memorandum, “Investigating Per- and Polyfluoroalkyl Substances within the Department of Defense Cleanup Program” dated August 24, 2023.

SAMPLE DELIVERY GROUP CASE NARRATIVE

Client: AECOM, INC. **Job No:** FC23797

Site: N6274224F0139 Extended Drinking Water **Report Date** 4/18/2025 10:20:51 A

On 04/09/2025, 3 Sample(s), 0 Trip Blank(s), 0 Equip. Blank(s) and 1 Field Blank(s) were received at (b) (4) [redacted]. at a maximum corrected temperature of 5 C. Samples were intact and chemically preserved, unless noted below. A (b) (4) [redacted] Job Number of FC23797 was assigned to the project.

Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section. Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

MS Semi-volatiles By Method EPA 533

Matrix: DW **Batch ID:** OP8808

- All samples were extracted within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- Sample(s) FC23797-1MS, FC23797-2DUP were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.

MS Semi-volatiles By Method EPA 537.1 REV 2.0

Matrix: DW **Batch ID:** OP8806

- All samples were extracted within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- Sample(s) FC23797-2AMS, FC23797-3ADUP, FC23797-2AMS were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.
- Blank Spike Recovery(s) for Perfluorotridecanoic acid are outside control limits.
- Matrix Spike Recovery(s) for Perfluorotetradecanoic acid are outside control limits. Probable cause is due to matrix interference.
- Matrix Spike Recovery(s) for Perfluorotetradecanoic acid are outside control limits. Probable cause is due to the ratio of spike to sample concentration < 4.
- RPD(s) for Duplicate for Perfluorooctanesulfonic acid are outside control limits for sample OP8806-DUP. Probable cause is due to sample non-homogeneity.
- Sample(s) FC23797-2A, FC23797-3A, FC23797-4A have surrogates outside control limits.
- FC23797-3A: Confirmation run.
- FC23797-2A: Insufficient sample for re-extraction.
- FC23797-2A: Confirmation run.
- FC23797-4A: Confirmation run.
- FC23797-4A: Insufficient sample for re-extraction.
- FC23797-3A: Insufficient sample for re-extraction.
- FC23797-3A for Perfluorododecanoic acid: Associated ICV and CCV outside control limits high, sample was ND.
- FC23797-4A for Perfluorododecanoic acid: Associated ICV and CCV outside control limits high, sample was ND.
- FC23797-2A for Perfluorododecanoic acid: Associated ICV and CCV outside control limits high, sample was ND.
- OP8806-MB for 13C2-PFDA: Outside control limits.
- OP8806-MB for 13C3-HFPO-DA: Outside control limits.
- OP8806-MB for 13C2-PFHxA: Outside control limits.
- OP8806-MB for 13C2-PFDA: Outside control limits.
- OP8806-BS for 13C2-PFHxA: Outside control limits.
- FC23797-1A for Perfluorododecanoic acid: Associated ICV and CCV outside control limits high, sample was ND.
- OP8806-MB for d5-EtFOSAA: Outside control limits.
- OP8806-MB for 13C2-PFHxA: Outside control limits.
- OP8806-BS for d5-EtFOSAA: Outside control limits.
- OP8806-BS for 13C2-PFHxA: Outside control limits.
- OP8806-MB for d5-EtFOSAA: Outside control limits.
- OP8806-MB for 13C3-HFPO-DA: Outside control limits.

Matrix: DW **Batch ID:** OP8904

- Sample(s) FC23797-1A have surrogates outside control limits.
- FC23797-1A: Confirmation run.

(b) (4) certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting the Quality System precision, accuracy and completeness objectives except as noted. Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria. (b) (4) is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety.

(b) (4) Sample Receipt Summary

Job Number: fc23797 **Client:** AECOM **Project:** N6274224F0139 Extended Drinking Water

Date / Time Received: 4/9/2025 5:30:00 PM **Delivery Method:** United Cargo/Airspace **Airbill #'s:** United Cargo AWB #: 016-66358596

Cooler Temps (Raw Measured) °C: Cooler 1: (4.6);

Cooler Temps (Corrected) °C: Cooler 1: (5.0);

Cooler Informatio	Y	or	N
1. Custody Seals Present:	☑		☐
2. Custody Seals Intact:	☑		☐
3. Temp criteria achieved:	☑		☐
4. Cooler temp verification:	IR Gun		
5. Cooler media:	Ice (Bag)		

Trip Blank Information	Y	or	N	N/A
1. Trip Blank present / cooler:	☐		☐	☑
2. Trip Blank listed on COC:	☐		☐	☑

	W	or	S	N/A
3. Type of TB Received	☐		☐	☑

Sample Information	Y	or	N	N/A
1. Sample labels present on bottles:	☑		☐	
2. Samples presented properly	☑		☐	
3. Sufficient volume/containers recv'd for analysi	☑		☐	
4. Condition of sample:	Intact			
5. Sample recv'd within HT	☑		☐	
6. Dates/Times/IDs on COC match sample labe	☑		☐	
7. VOCs have headspace	☐		☐	☑
8. Bottles received for unspecified tests	☐		☑	
9. Compositing instructions clear	☐		☐	☑
10. Voa Soil Kits/Jars received past 48hrs?	☐		☐	☑
11. % Solids Jar Received?	☐		☐	☑
12. Residual Chlorine Present?	☐		☐	☑

Misc Information

Number of Encores: 25 Gram 5 Gram

Test Strip Lot #s: pH 0-3: 226422 pH 10-12: Number of Lab Filtered Metals Other: (Specify) 0-14 210224

SAMPLE DELIVERY GROUP CASE NARRATIVE

Client: AECOM, INC. **Job No:** FC23797

Site: N6274224F0139 Extended Drinking Water **Report Date** 4/18/2025 10:20:51 A

On 04/09/2025, 3 Sample(s), 0 Trip Blank(s), 0 Equip. Blank(s) and 1 Field Blank(s) were received at (b) (4) [redacted]. at a maximum corrected temperature of 5 C. Samples were intact and chemically preserved, unless noted below. A (b) (4) [redacted] Job Number of FC23797 was assigned to the project.

Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section. Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

MS Semi-volatiles By Method EPA 533

Matrix: DW **Batch ID:** OP8808

- All samples were extracted within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- Sample(s) FC23797-1MS, FC23797-2DUP were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.

MS Semi-volatiles By Method EPA 537.1 REV 2.0

Matrix: DW **Batch ID:** OP8806

- All samples were extracted within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- Sample(s) FC23797-2AMS, FC23797-3ADUP, FC23797-2AMS were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.
- Blank Spike Recovery(s) for Perfluorotridecanoic acid are outside control limits.
- Matrix Spike Recovery(s) for Perfluorotetradecanoic acid are outside control limits. Probable cause is due to matrix interference.
- Matrix Spike Recovery(s) for Perfluorotetradecanoic acid are outside control limits. Probable cause is due to the ratio of spike to sample concentration < 4.
- RPD(s) for Duplicate for Perfluorooctanesulfonic acid are outside control limits for sample OP8806-DUP. Probable cause is due to sample non-homogeneity.
- Sample(s) FC23797-2A, FC23797-3A, FC23797-4A have surrogates outside control limits.
- FC23797-3A: Confirmation run.
- FC23797-2A: Insufficient sample for re-extraction.
- FC23797-2A: Confirmation run.
- FC23797-4A: Confirmation run.
- FC23797-4A: Insufficient sample for re-extraction.
- FC23797-3A: Insufficient sample for re-extraction.
- FC23797-3A for Perfluorododecanoic acid: Associated ICV and CCV outside control limits high, sample was ND.
- FC23797-4A for Perfluorododecanoic acid: Associated ICV and CCV outside control limits high, sample was ND.
- FC23797-2A for Perfluorododecanoic acid: Associated ICV and CCV outside control limits high, sample was ND.
- OP8806-MB for 13C2-PFDA: Outside control limits.
- OP8806-MB for 13C3-HFPO-DA: Outside control limits.
- OP8806-MB for 13C2-PFHxA: Outside control limits.
- OP8806-MB for 13C2-PFDA: Outside control limits.
- OP8806-BS for 13C2-PFHxA: Outside control limits.
- FC23797-1A for Perfluorododecanoic acid: Associated ICV and CCV outside control limits high, sample was ND.
- OP8806-MB for d5-EtFOSAA: Outside control limits.
- OP8806-MB for 13C2-PFHxA: Outside control limits.
- OP8806-BS for d5-EtFOSAA: Outside control limits.
- OP8806-BS for 13C2-PFHxA: Outside control limits.
- OP8806-MB for d5-EtFOSAA: Outside control limits.
- OP8806-MB for 13C3-HFPO-DA: Outside control limits.

Matrix: DW **Batch ID:** OP8904

- Sample(s) FC23797-1A have surrogates outside control limits.
- FC23797-1A: Confirmation run.

(b) (4) certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting the Quality System precision, accuracy and completeness objectives except as noted. Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria. (b) (4) is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety.

Date / Time Received: 4/9/2025 5:30:00 PM **Delivery Method:** United Cargo/Airspace **Airbill #'s:** United Cargo AWB #: 016-66358596

Cooler Temps (Raw Measured) °C: Cooler 1: (4.6);

Cooler Temps (Corrected) °C: Cooler 1: (5.0);

Cooler Informatio	Y	or	N
1. Custody Seals Present:	☑		☐
2. Custody Seals Intact:	☑		☐
3. Temp criteria achieved:	☑		☐
4. Cooler temp verification:	IR Gun		
5. Cooler media:	Ice (Bag)		

Trip Blank Information	Y	or	N	N/A
1. Trip Blank present / cooler:	☐		☐	☑
2. Trip Blank listed on COC:	☐		☐	☑

	W	or	S	N/A
3. Type of TB Received	☐		☐	☑

Sample Information	Y	or	N	N/A
1. Sample labels present on bottles:	☑		☐	
2. Samples presented properly	☑		☐	
3. Sufficient volume/containers recv'd for analysi	☑		☐	
4. Condition of sample:	Intact			
5. Sample recv'd within HT	☑		☐	
6. Dates/Times/IDs on COC match sample labe	☑		☐	
7. VOCs have headspace	☐		☐	☑
8. Bottles received for unspecified tests	☐		☑	
9. Compositing instructions clear	☐		☐	☑
10. Voa Soil Kits/Jars received past 48hrs?	☐		☐	☑
11. % Solids Jar Received?	☐		☐	☑
12. Residual Chlorine Present?	☐		☐	☑

Misc Information

Number of Encores: 25 Gram 5 Gram

Test Strip Lot #s: pH 0-3: 226422 pH 10-12: Number of Lab Filtered Metals

Residual Chlorine Test Strip Lot Other: (Specify) 0-14 210224

Manual Integration Approval Summary

Sample Number: OP8806-MS
Lab FileID: 5Q31704.D
Injection Time: 04/11/25 15:50
Method: EPA 537.1 REV 2.0
Analyst approved: 04/15/25 15:44 (b) (6)
Supervisor approved: 04/15/25 15:59 (b) (6)

Parameter	CAS	Sig#	R.T. (min.)	Reason
HFPO-DA (GenX)	13252-13-6		5.01	Poor instrument integration
Perfluorohexanesulfonic acid	355-46-4		5.63	Split peak
Perfluorooctanesulfonic acid	1763-23-1		6.85	Split peak
Perfluorononanoic acid	375-95-1		6.87	Split peak
MeFOSAA	2355-31-9		7.24	Split peak
EtFOSAA	2991-50-6		7.38	Split peak

Manual Integration Approval Summary

Sample Number: S3Q1491-IC1491
Lab FileID: 3Q101430.D
Injection Time: 04/11/25 15:42
Method: EPA 533
Analyst approved: 04/14/25 11:45 (b) (6)
Supervisor approved: 04/14/25 12:44 (b) (6)

Parameter	CAS	Sig#	R.T. (min.)	Reason
HFPO-DA (GenX)	13252-13-6		6.05	Poor instrument integration
Perfluorohexanesulfonic acid	355-46-4		6.74	Split peak
Perfluorooctanesulfonic acid	1763-23-1		7.98	Split peak

Manual Integrations APPROVED (compounds with "m" flag)
(b) (6)

Manual Integration Approval Summary

Sample Number:	S3Q1491-ECC1491	**Method:**	EPA 533
Lab FileID:	3Q101451.D	**Analyst approved:**	04/14/25 11:45 (b) (6)
Injection Time:	04/11/25 21:20	**Supervisor approved:**	04/14/25 12:44 (b) (6)

Parameter	CAS	Sig#	R.T. (min.)	Reason
Perfluorohexanesulfonic acid	355-46-4		6.72	Split peak
Perfluorooctanesulfonic acid	1763-23-1		7.97	Split peak

QQQ Check Tune Report

(b) (4)

Instrument Name	LCMS5Q
MS Model	G6470B
MS Instrument Serial	SG2221G211
Software_Firmware Version	10.1.67, FW: A.00.08.112
Tune Date & Time	08 April 2025 16:48:23
File Path	D:\MassHunter\Tune\QQQ\G6470B\atunes.TUNE.XML
Ion Source	AJS ESI
Ionization Mode	AJS ESI
Tuned Resolution	All
Vacuum Pressure	1.33E+0 [R] (Torr); 3.48E-5 [H] (Torr)

Source Parameters

Parameter	Negative
Gas Temp (°C)	300
Gas Flow (l/min)	8
Nebulizer (psi)	15
Capillary (V)	3500
Nozzle Voltage (V)	1500
Sheath Gas Temp (°C)	250
Sheath Gas Flow (l/min)	7

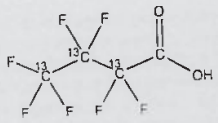
PRODUCT CODE:	M3PFBA	**LOT NUMBER:**	M3PFBA0124
COMPOUND:	Perfluoro-n-(2,3,4-$^{13}C_3$)butanoic acid		
		CAS #:	Not available

STRUCTURE:



MOLECULAR FORMULA:	$^{13}C_3{}^{12}CHF_7O_2$	**MOLECULAR WEIGHT:**	217.02
CONCENTRATION:	50.0 ± 2.5 µg/mL	**SOLVENT(S):**	Methanol Water (<1%)
CHEMICAL PURITY:	>98%	**ISOTOPIC PURITY:**	≥99% ^{13}C
LAST TESTED: (mm/dd/yyyy)	01/24/2024		
EXPIRY DATE: (mm/dd/yyyy)	01/24/2029		
RECOMMENDED STORAGE:	Store ampoule in a cool, dark place		

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acid to the methyl ester.
- Contains ~0.2% of perfluoro-n-($^{13}C_3$)propanoic acid, and also contains ~1.0% of perfluoro-n-($^{13}C_4$)butanoic acid (MPFBA) due to the naturally occurring isotopic abundance of ^{13}C in the unlabelled carbon atom.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

MPFAC-24ES

Mass-Labelled PFAS
Extraction Standard Solution

PRODUCT CODE:	MPFAC-24ES
LOT NUMBER:	MPFAC24ES0424
SOLVENT(S):	Methanol/Isopropanol (2%)/Water (<1%)
DATE PREPARED: (mm/dd/yyyy)	04/30/2024
LAST TESTED: (mm/dd/yyyy)	05/02/2024
EXPIRY DATE: (mm/dd/yyyy)	05/02/2029
RECOMMENDED STORAGE:	Refrigerate ampoule

DESCRIPTION:

MPFAC-24ES is a solution/mixture of mass-labelled (^{13}C) perfluoroalkylcarboxylic acids (C_4-C_{12} and C_{14}), mass-labelled (^{13}C) perfluoroalkanesulfonates (C_4, C_6, and C_8), mass-labelled (^{13}C) telomer sulfonates (4:2, 6:2, and 8:2), two mass-labelled (^{2}H) perfluorooctanesulfonamidoacetic acids, and perfluoro-1-($^{13}C_8$)octanesulfonamide. The components and their concentrations are given in Table A.

The individual ^{13}C-labelled perfluoroalkylcarboxylic acids, ^{13}C-labelled perfluoroalkanesulfonates, ^{13}C-labelled telomer sulfonates, and perfluoro-1-($^{13}C_8$)octanesulfonamide all have chemical purities of >98% and isotopic purities of ≥99%. The individual ^{2}H-labelled perfluorooctanesulfonamidoacetic acids all have chemical purities of >98% and isotopic purities of ≥98%.

DOCUMENTATION/ DATA ATTACHED:

Table A: Components and Concentrations of the Solution/Mixture
Figure 1: LC/MS Data (SIR)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acids to their respective methyl esters.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

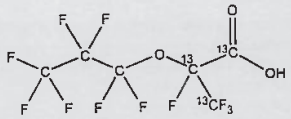
PRODUCT CODE:	M3HFPO-DA
LOT NUMBER:	M3HFPODA0624
COMPOUND:	$^{13}C_3$-Hexafluoropropylene oxide dimer acid
IUPAC NAME:	2,3,3,3-Tetrafluoro-2-(1,1,2,2,3,3,3-heptafluoropropoxy)($^{13}C_3$)propanoic acid
STRUCTURE:	
CAS #:	Not available



MOLECULAR FORMULA:	$^{13}C_3{}^{12}C_3HF_{11}O_3$	**MOLECULAR WEIGHT:**	333.03
CONCENTRATION:	50.0 ± 2.5 µg/mL	**SOLVENT(S):**	Methanol
CHEMICAL PURITY:	>98%	**ISOTOPIC PURITY:**	≥99% ^{13}C
LAST TESTED: (mm/dd/yyyy)	06/10/2024		
EXPIRY DATE: (mm/dd/yyyy)	06/10/2027		
RECOMMENDED STORAGE:	Refrigerate ampoule		

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- This product is commercially known as $^{13}C_3$-GenX.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Certified By (b) (6) **Date:** 06/11/2024 (mm/dd/yyyy)

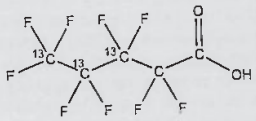
PRODUCT CODE: M3PFPeA
COMPOUND: Perfluoro-n-(3,4,5-$^{13}C_3$)pentanoic acid

LOT NUMBER: M3PFPeA0723

CAS #: Not available

STRUCTURE:



MOLECULAR FORMULA: $^{13}C_3{}^{12}C_2HF_9O_2$
CONCENTRATION: 50.0 ± 2.5 µg/mL

MOLECULAR WEIGHT: 267.02
SOLVENT(S): Methanol
Water (<1%)

CHEMICAL PURITY: >98%
LAST TESTED: (mm/dd/yyyy) 07/24/2023
EXPIRY DATE: (mm/dd/yyyy) 07/24/2028
RECOMMENDED STORAGE: Store ampoule in a cool, dark place

ISOTOPIC PURITY: ≥99% ^{13}C (3,4,5-$^{13}C_3$)

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acid to the methyl ester.
- Contains ~0.9% of perfluoro-n-($^{13}C_3$)butanoic acid (M3PFBA).

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

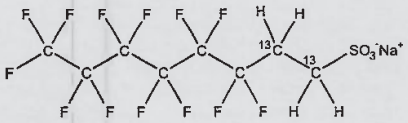
COMPOUND:	Sodium 1H,1H,2H,2H-perfluoro-(1,2-$^{13}C_2$)octanesulfonate		
STRUCTURE:		**CAS #:**	2708218-89-5



MOLECULAR FORMULA:	$^{13}C_2{}^{12}C_6H_4F_{13}SO_3Na$	**MOLECULAR WEIGHT:**	452.13
CONCENTRATION:	50.0 ± 2.5 µg/mL (Na salt) 47.6 ± 2.4 µg/mL (M2-6:2FTS acid) 47.5 ± 2.4 µg/mL (M2-6:2FTS anion)	**SOLVENT(S):**	Methanol
CHEMICAL PURITY:	>98%	**ISOTOPIC PURITY:**	≥99% ^{13}C ($1,2\text{-}^{13}C_2$)
LAST TESTED: (mm/dd/yyyy)	11/24/2022		
EXPIRY DATE: (mm/dd/yyyy)	11/24/2027		
RECOMMENDED STORAGE:	Refrigerate ampoule		

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- The native 6:2FTS contains 4.22% of ^{34}S (due to natural isotopic abundance) therefore both native 6:2FTS and M2-6:2FTS will produce signals in the m/z 429 to m/z 409 channel during SRM analysis. We recommend using the m/z 429 to m/z 81 transition to monitor for M2-6:2FTS during quantitative analysis as it will be free of any native contribution (see Figure 2).

PFAC30PAR

Native Per- and Polyfluoroalkyl Substance
Precision and Recovery Standard Solution

PRODUCT CODE:	PFAC30PAR
LOT NUMBER:	PFAC301123
SOLVENT(S):	Methanol/Isopropanol (6%)/Water (<1%)
DATE PREPARED: (mm/dd/yyyy)	11/20/2023
LAST TESTED: (mm/dd/yyyy)	11/22/2023
EXPIRY DATE: (mm/dd/yyyy)	11/30/2026
RECOMMENDED STORAGE:	Refrigerate ampoule

DESCRIPTION:

PFAC30PAR is a solution/mixture of native linear perfluoroalkylcarboxylic acids (C_4-C_{14}), perfluoroalkanesulfonates (C_4, C_5, C_7, C_9, and C_{10} linear; C_6 and C_8 linear and branched), fluorotelomer sulfonates (4:2, 6:2, and 8:2), linear and branched perfluorooctanesulfonamidoacetic acids, perfluoroalkanesulfonamides (C_4, C_6, and C_8), sodium dodecafluoro-3H-4,8-dioxanonanoate (NaDONA), the major and minor components of F-53B (9Cl-PF3ONS and 11Cl-PF3OUdS), and hexafluoropropylene oxide dimer acid (GenX, HFPO-DA). The components and their concentrations are given in Table A.

The individual components all have chemical purities of >98%.

DOCUMENTATION/ DATA ATTACHED:

Table A: Components and Concentrations of the Solution/Mixture
Table B: Isomeric Components and Percent Composition of N-MeFOSAA
Table C: Isomeric Components and Percent Composition of N-EtFOSAA
Table D: Isomeric Components and Percent Composition of PFHxSK
Table E: Isomeric Components and Percent Composition of PFOSK
Figure 1: LC/MS Data (SIR)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acids to their respective methyl esters.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

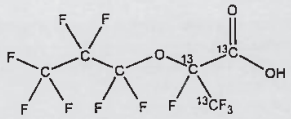
DOCUMENTATION

PRODUCT CODE:	M3HFPO-DA
COMPOUND:	$^{13}C_3$-Hexafluoropropylene oxide dimer acid
IUPAC NAME:	2,3,3,3-Tetrafluoro-2-(1,1,2,2,3,3,3-heptafluoropropoxy)($^{13}C_3$)propanoic acid
LOT NUMBER:	M3HFPODA0624
CAS #:	Not available

STRUCTURE:



MOLECULAR FORMULA:	$^{13}C_3{}^{12}C_3HF_{11}O_3$
CONCENTRATION:	50.0 ± 2.5 µg/mL
CHEMICAL PURITY:	>98%
LAST TESTED: (mm/dd/yyyy)	06/10/2024
EXPIRY DATE: (mm/dd/yyyy)	06/10/2027
RECOMMENDED STORAGE:	Refrigerate ampoule
MOLECULAR WEIGHT:	333.03
SOLVENT(S):	Methanol
ISOTOPIC PURITY:	≥99% ^{13}C

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- This product is commercially known as $^{13}C_3$-GenX.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Certified By (b) (6) **Date:** 06/11/2024 (mm/dd/yyyy)

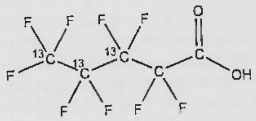
PRODUCT CODE: M3PFPeA
COMPOUND: Perfluoro-n-(3,4,5-$^{13}C_3$)pentanoic acid

LOT NUMBER: M3PFPeA0723

CAS #: Not available

STRUCTURE:



MOLECULAR FORMULA: $^{13}C_3{}^{12}C_2HF_9O_2$
CONCENTRATION: 50.0 ± 2.5 µg/mL

MOLECULAR WEIGHT: 267.02
SOLVENT(S): Methanol
Water (<1%)

CHEMICAL PURITY: >98%
LAST TESTED: (mm/dd/yyyy) 07/24/2023
EXPIRY DATE: (mm/dd/yyyy) 07/24/2028
RECOMMENDED STORAGE: Store ampoule in a cool, dark place

ISOTOPIC PURITY: ≥99% ^{13}C (3,4,5-$^{13}C_3$)

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acid to the methyl ester.
- Contains ~0.9% of perfluoro-n-($^{13}C_3$)butanoic acid (M3PFBA).

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

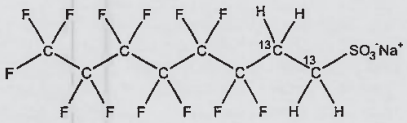
COMPOUND:	Sodium 1H,1H,2H,2H-perfluoro-(1,2-$^{13}C_2$)octanesulfonate		
STRUCTURE:		**CAS #:**	2708218-89-5



MOLECULAR FORMULA:	$^{13}C_2{}^{12}C_6H_4F_{13}SO_3Na$	**MOLECULAR WEIGHT:**	452.13
CONCENTRATION:	50.0 ± 2.5 µg/mL (Na salt) 47.6 ± 2.4 µg/mL (M2-6:2FTS acid) 47.5 ± 2.4 µg/mL (M2-6:2FTS anion)	**SOLVENT(S):**	Methanol
CHEMICAL PURITY:	>98%	**ISOTOPIC PURITY:**	≥99% ^{13}C ($1,2\text{-}^{13}C_2$)
LAST TESTED: (mm/dd/yyyy)	11/24/2022		
EXPIRY DATE: (mm/dd/yyyy)	11/24/2027		
RECOMMENDED STORAGE:	Refrigerate ampoule		

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- The native 6:2FTS contains 4.22% of ^{34}S (due to natural isotopic abundance) therefore both native 6:2FTS and M2-6:2FTS will produce signals in the m/z 429 to m/z 409 channel during SRM analysis. We recommend using the m/z 429 to m/z 81 transition to monitor for M2-6:2FTS during quantitative analysis as it will be free of any native contribution (see Figure 2).

PFAC30PAR

Native Per- and Polyfluoroalkyl Substance
Precision and Recovery Standard Solution

PRODUCT CODE:	PFAC30PAR
LOT NUMBER:	PFAC301123
SOLVENT(S):	Methanol/Isopropanol (6%)/Water (<1%)
DATE PREPARED: (mm/dd/yyyy)	11/20/2023
LAST TESTED: (mm/dd/yyyy)	11/22/2023
EXPIRY DATE: (mm/dd/yyyy)	11/30/2026
RECOMMENDED STORAGE:	Refrigerate ampoule

DESCRIPTION:

PFAC30PAR is a solution/mixture of native linear perfluoroalkylcarboxylic acids (C_4-C_{14}), perfluoroalkanesulfonates (C_4, C_5, C_7, C_9, and C_{10} linear; C_6 and C_8 linear and branched), fluorotelomer sulfonates (4:2, 6:2, and 8:2), linear and branched perfluorooctanesulfonamidoacetic acids, perfluoroalkanesulfonamides (C_4, C_6, and C_8), sodium dodecafluoro-3H-4,8-dioxanonanoate (NaDONA), the major and minor components of F-53B (9Cl-PF3ONS and 11Cl-PF3OUdS), and hexafluoropropylene oxide dimer acid (GenX, HFPO-DA). The components and their concentrations are given in Table A.

The individual components all have chemical purities of >98%.

DOCUMENTATION/ DATA ATTACHED:

Table A: Components and Concentrations of the Solution/Mixture
Table B: Isomeric Components and Percent Composition of N-MeFOSAA
Table C: Isomeric Components and Percent Composition of N-EtFOSAA
Table D: Isomeric Components and Percent Composition of PFHxSK
Table E: Isomeric Components and Percent Composition of PFOSK
Figure 1: LC/MS Data (SIR)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acids to their respective methyl esters.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

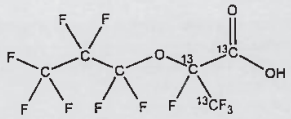
PRODUCT CODE:	M3HFPO-DA
LOT NUMBER:	M3HFPODA0624
COMPOUND:	$^{13}C_3$-Hexafluoropropylene oxide dimer acid
IUPAC NAME:	2,3,3,3-Tetrafluoro-2-(1,1,2,2,3,3,3-heptafluoropropoxy)($^{13}C_3$)propanoic acid
STRUCTURE:	
CAS #:	Not available



MOLECULAR FORMULA:	$^{13}C_3{}^{12}C_3HF_{11}O_3$	**MOLECULAR WEIGHT:**	333.03
CONCENTRATION:	50.0 ± 2.5 µg/mL	**SOLVENT(S):**	Methanol
CHEMICAL PURITY:	>98%	**ISOTOPIC PURITY:**	≥99% ^{13}C
LAST TESTED: (mm/dd/yyyy)	06/10/2024		
EXPIRY DATE: (mm/dd/yyyy)	06/10/2027		
RECOMMENDED STORAGE:	Refrigerate ampoule		

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- This product is commercially known as $^{13}C_3$-GenX.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Certified By (b) (6) **Date:** 06/11/2024 (mm/dd/yyyy)

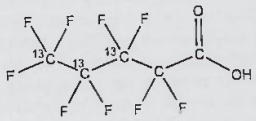
PRODUCT CODE: M3PFPeA
COMPOUND: Perfluoro-n-(3,4,5-$^{13}C_3$)pentanoic acid

LOT NUMBER: M3PFPeA0723

CAS #: Not available

STRUCTURE:



MOLECULAR FORMULA: $^{13}C_3{}^{12}C_2HF_9O_2$
CONCENTRATION: 50.0 ± 2.5 µg/mL

MOLECULAR WEIGHT: 267.02
SOLVENT(S): Methanol
Water (<1%)

CHEMICAL PURITY: >98%
LAST TESTED: (mm/dd/yyyy) 07/24/2023
EXPIRY DATE: (mm/dd/yyyy) 07/24/2028
RECOMMENDED STORAGE: Store ampoule in a cool, dark place

ISOTOPIC PURITY: ≥99% ^{13}C (3,4,5-$^{13}C_3$)

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acid to the methyl ester.
- Contains ~0.9% of perfluoro-n-($^{13}C_3$)butanoic acid (M3PFBA).

CONCENTRATION:	50.0 ± 2.5 µg/mL (Na salt) 47.6 ± 2.4 µg/mL (M2-6:2FTS acid) 47.5 ± 2.4 µg/mL (M2-6:2FTS anion)	**SOLVENT(S):**	Methanol
CHEMICAL PURITY:	>98%	**ISOTOPIC PURITY:**	≥99% ^{13}C ($1,2\text{-}^{13}C_2$)
LAST TESTED: (mm/dd/yyyy)	11/24/2022		
EXPIRY DATE: (mm/dd/yyyy)	11/24/2027		
RECOMMENDED STORAGE:	Refrigerate ampoule		

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- The native 6:2FTS contains 4.22% of ^{34}S (due to natural isotopic abundance) therefore both native 6:2FTS and M2-6:2FTS will produce signals in the m/z 429 to m/z 409 channel during SRM analysis. We recommend using the m/z 429 to m/z 81 transition to monitor for M2-6:2FTS during quantitative analysis as it will be free of any native contribution (see Figure 2).

PFAC30PAR

Native Per- and Polyfluoroalkyl Substance
Precision and Recovery Standard Solution

PRODUCT CODE:	PFAC30PAR
LOT NUMBER:	PFAC301123
SOLVENT(S):	Methanol/Isopropanol (6%)/Water (<1%)
DATE PREPARED: (mm/dd/yyyy)	11/20/2023
LAST TESTED: (mm/dd/yyyy)	11/22/2023
EXPIRY DATE: (mm/dd/yyyy)	11/30/2026
RECOMMENDED STORAGE:	Refrigerate ampoule

DESCRIPTION:

PFAC30PAR is a solution/mixture of native linear perfluoroalkylcarboxylic acids (C_4-C_{14}), perfluoroalkanesulfonates (C_4, C_5, C_7, C_9, and C_{10} linear; C_6 and C_8 linear and branched), fluorotelomer sulfonates (4:2, 6:2, and 8:2), linear and branched perfluorooctanesulfonamidoacetic acids, perfluoroalkanesulfonamides (C_4, C_6, and C_8), sodium dodecafluoro-3H-4,8-dioxanonanoate (NaDONA), the major and minor components of F-53B (9Cl-PF3ONS and 11Cl-PF3OUdS), and hexafluoropropylene oxide dimer acid (GenX, HFPO-DA). The components and their concentrations are given in Table A.

The individual components all have chemical purities of >98%.

DOCUMENTATION/ DATA ATTACHED:

Table A: Components and Concentrations of the Solution/Mixture
Table B: Isomeric Components and Percent Composition of N-MeFOSAA
Table C: Isomeric Components and Percent Composition of N-EtFOSAA
Table D: Isomeric Components and Percent Composition of PFHxSK
Table E: Isomeric Components and Percent Composition of PFOSK
Figure 1: LC/MS Data (SIR)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acids to their respective methyl esters.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

EXECUTIVE NARRATIVE

Sample Delivery Group: FC23797
Laboratory: (b) (4)
Site: Red Hill Bulk Fuel Storage Facility, Joint Base Pearl Harbor-Hickam, Oahu, Hawaii, Extended Drinking Water Monitoring, NAH Shaft Treatment System Pilot Study
Sampling dates: 04/08/2025
Number of Samples: 4
Test Method: USEPA method 533
Analysis: Per-fluorinated Alkyl Substances (PFAS)

Quality Assurance Project Plan: Final Extended Drinking Water Monitoring Plan Joint Base Pearl Harbor-Hickam Public Water System #HI0000360 and Aliamanu Military Reservation PWS #HI0000337 O‘ahu, Hawai‘i, March 2024.

Validation Guidelines: Data Review and Validation Guidelines for Perfluoroalkyl Substances (PFASs) Analyzed Using EPA Method 537, EPA 910-R-18-001 (November 2018); National Functional Guidelines for High Resolution Superfund Methods Data Review, OLEM 9240.1-65, EPA-542-R-20-007, (November 2020).

Client Sample ID	Laboratory Sample ID	Matrix	Validation Stage
SHAFT-HW-0018384-25098-N	FC23797-1	Drinking Water	S4VEM
SHAFT-HW-0018393-25098-N	FC23797-2	Drinking Water	S4VEM
SHAFT-HW-0018394-25098-N	FC23797-3	Drinking Water	S4VEM
SHAFT-FB-250408-25098-N	FC23797-4	Field blank	S4VEM

Table 1 provides a summary of the major and minor data quality issues identified in this data set. All data are acceptable except those results which have been qualified with “R”, rejected. Data validation qualifiers along with associated descriptions are provided in Table 2. All data qualification related to this group of samples is detailed on the attached sheets.

All data users should note two facts. First, an "R" flag means that the associated value is unusable due to significant quality control (QC) problems, the data is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on any data tables even as a last resort. Second, no analyte concentration, even if it passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

DATA ASSESSMENT

1. NARRATIVE AND COMPLETENESS REVIEW

The case narrative was reviewed, and the data package was checked for completeness. No discrepancies were noted.

2. SAMPLE DELIVERY AND CONDITION

The samples arrived at the laboratory in acceptable condition. Proper custody was documented.

3. HOLDING TIME

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detect results will be flagged as not detected at an estimated quantitation limit, "UJ", unless the holding time is grossly exceeded (by more than two times the holding time specified), in which case non-detect results are flagged "R", rejected. Qualifications were applied to the samples and analytes as shown below.

All sample analyses were within the validation guidance.

4. MASS CALIBRATION

Mass calibration range must bracket the ion masses of interest. The most recent mass calibration must be used for every acquisition in an analytical run. Mass calibration must be verified to be ±0.5 amu of the true value, by acquiring a full scan continuum mass spectrum of a PFAS.

No problems were found for this criterion.

5. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument can produce acceptable quantitative data. An initial calibration demonstrates that the instrument can give acceptable performance at the beginning of an experimental sequence. The continuing calibration checks document that the instrument is providing satisfactory daily performance. Additionally, a continuing calibration is analyzed at the end of each 12-hour analytical sequence, denoted as a "closing" calibration verification and ascertains acceptable performance at the conclusion of the analytical sequence.

A) Initial Calibration

Percent Relative Standard Deviation (%RSD) is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent RSD must be less than the maximum %RSD, in cases where linear and non-linear regressions are used, linear correlation coefficients must be greater than the minimum requirement. If the %RSD or correlation coefficient do not meet quality control criteria, detects may be qualified as "J" and professional judgement is used to qualify non-detects. Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion.

B) Continuing Calibration

Percent difference (%D) compares the response factor of the continuing calibration check to mean response factor (RF) from the initial calibration. The %D for all analytes and surrogates in the continuing calibration verifications (CCVs) must be <30%. A value outside of these limits indicates potential detection and quantitation errors. If the %D exceeds quality control criteria, the positive results are flagged as estimated, "J" and non-detects are flagged "UJ". Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion.

6. BLANKS

Quality assurance (QA) blanks (i.e. method, storage, trip, field, or rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation and analysis or field activity. Method and storage blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. Qualifications were applied to the samples and analytes as shown below.

A) Laboratory Blanks

Method blanks were analyzed with appropriate frequency. No problems were found for this criterion.

B) Equipment / Field Blanks

Sample SHAFT-FB-250408-25098-N was submitted as a field blank in association with this sample delivery group (SDG). No problems were found for this criterion.

7. ISOTOPE DILUTION ANALOGUES

All samples are fortified with isotopically labeled analogues prior to sample preparation and analyses to evaluate overall laboratory performance and efficiency of the analytical technique. The reported project samples and laboratory quality control samples had observed isotope dilution analogue recoveries within the established limits in all cases with the following exceptions.

No problems were found for this criterion.

8. COMPOUND IDENTIFICATION

Compound Identification

The project target analyte compounds are identified on the LC/MS/MS by using the analytes relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within ±0.06 RRT units of the standard compound and have ion spectra with primary and when available secondary characteristic ions present. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications.

Target compound identifications were reviewed for samples at the Stage 4 level. No anomalies were identified.

9. MATRIX SPIKE/MATRIX SPIKE DUPLICATE / MATRIX DUPLICATE

Matrix spike/matrix spike duplicate (MS/MSD) data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD data may be used in conjunction with other quality control criteria for additional qualification of data.

Sample SHAFT-HW-0018384-25098-N was submitted for MS evaluation in association with this SDG. Upon evaluation all accuracy indicators were acceptable.

Sample SHAFT-HW-0018393-25098-N was submitted for matrix duplicate evaluation in association with this SDG. Upon evaluation adequate laboratory precision was demonstrated.

10. LABORATORY CONTROL SAMPLE

The Laboratory Control Sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Aqueous/water, soil/sediment, wipe, and filter LCSs shall be analyzed for each analyte utilizing the same sample preparations, analytical methods, and quality assurance/quality control (QA/QC) procedures as employed for the samples. All LCS percent recoveries must fall within the control limits. Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion.

11. FIELD DUPLICATE

Field duplicates may be taken and analyzed as an indication of overall precision. These analyses measure both field and laboratory precision. A control limit of 30% for the Relative Percent Difference (RPD) shall be used for original and duplicate sample values greater than or equal to five times the LOQ. A control limit of two times the LOQ shall be used if either the sample or duplicate value is less than five times the LOQ. For field duplicate analyses that do not meet the technical criteria, the action was applied to only the field sample and its duplicate.

No samples were submitted as a field duplicate pair in association with this SDG.

12. DILUTIONS, RE-EXTRACTIONS & REANALYSIS

Samples may be re-analyzed for dilution, re-extraction and for other QC reasons. In such cases, the best result values are used.

No re-extraction and/or reanalyses were provided for data review.

13. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT

Overall, the laboratory data generated met the project goals and quality control criteria, with the exceptions identified in this report and as summarized in Table 1.

14. OTHER PROBLEMS

None.

Table 1 Major and Minor Findings

	Were acceptance criteria met?		
	Yes	No	
Per-fluorinated Compounds		Major	Minor

NA = Not applicable

Table 2 Data Validation Qualifiers

Data Qualifier	Definition
U	The analyte was analyzed for but was not detected above the level of the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

Table 3 PFAS Definitions Table

	CAS Number	Compound	Abbreviation(s)
1	151772-58-6	Nonafluoro-3,6-dioxaheptanoic acid	NFDHA, PFECA B
2	113507-82-7	Perfluoro (2-ethoxyethane) sulfonic acid	PFEESA, PES
3	377-73-1	Perfluoro-3-methoxypropanoic acid	PFMPA, PRMOPrA, PFECA F
4	375-73-5	Perfluorobutanesulfonic acid	PFBS
5	863090-89-5	Perfluoro-4-methoxybutanoic acid	PFMBA, PFMOBA, PFECA A
6	13252-13-6	Hexafluoropropylene Oxide Dimer Acid	HFPO-DA, Gen-X, HFPODA
7	375-22-4	Perfluorobutanoic acid	PFBA
8	335-67-1	Perfluorooctanoic acid	PFOA
9	2706-91-4	Perfluoropentanesulfonic acid	PFPeS
10	1763-23-1	Perfluorooctanesulfonic acid	PFOS, PFOSA
11	2706-90-3	Perfluoropentanoic acid	PFPeA
12	2058-94-8	Perfluoroundecanoic acid	PFUnA, PFUnDA
13	375-95-1	Perfluorononanoic acid	PFNA
14	307-55-1	Perfluorododecanoic acid	PFDoA, PFDoDA
15	335-76-2	Perfluorodecanoic acid	PFDA

EXECUTIVE NARRATIVE

Sample Delivery Group: FC23797
Laboratory: (b) (4)
Site: Red Hill Bulk Fuel Storage Facility, Joint Base Pearl Harbor-Hickam, Oahu, Hawaii, EPA Co-Sampling, Extended Drinking Water Monitoring, NAH Shaft Treatment System Pilot Study
Sampling dates: 04/08/2025
Number of Samples: 4
Test Method: USEPA method 537.1
Analysis: Per-fluorinated Alkyl Substances (PFAS)

Quality Assurance Project Plan: Final Extended Drinking Water Monitoring Plan Joint Base Pearl Harbor-Hickam Public Water System #HI0000360 and Aliamanu Military Reservation PWS #HI0000337 O‘ahu, Hawai‘i, March 2024.

Validation Guidelines: Data Review and Validation Guidelines for Perfluoroalkyl Substances (PFASs) Analyzed Using EPA Method 537, EPA 910-R-18-001 (November 2018).

Client Sample ID	Laboratory Sample ID	Matrix	Validation Stage
SHAFT-HW-0018384-25098-N	FC23797-1A	Drinking Water	S4VEM
SHAFT-HW-0018393-25098-N	FC23797-2A	Drinking Water	S4VEM
SHAFT-HW-0018394-25098-N	FC23797-3A	Drinking Water	S4VEM
SHAFT-FB-250408-25098-N	FC23797-4A	Field blank	S4VEM

Table 1 provides a summary of the major and minor data quality issues identified in this data set. All data are acceptable except those results which have been qualified with “R”, rejected. Data validation qualifiers along with associated descriptions are provided in Table 2. All data qualification related to this group of samples is detailed on the attached sheets.

All data users should note two facts. First, an "R" flag means that the associated value is unusable due to significant quality control (QC) problems, the data is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on any data tables even as a last resort. Second, no analyte concentration, even if it passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

DATA ASSESSMENT

1. NARRATIVE AND COMPLETENESS REVIEW

The case narrative was reviewed, and the data package was checked for completeness. No discrepancies were noted.

2. SAMPLE DELIVERY AND CONDITION

The samples arrived at the laboratory in acceptable condition. Proper custody was documented.

3. HOLDING TIME

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detect results will be flagged as not detected at an estimated quantitation limit, "UJ", unless the holding time is grossly exceeded (by more than two times the holding time specified), in which case non-detect results are flagged "R", rejected. Qualifications were applied to the samples and analytes as shown below.

All sample analyses were within the validation guidance.

4. MASS CALIBRATION

Mass calibration range must bracket the ion masses of interest. The most recent mass calibration must be used for every acquisition in an analytical run. Mass calibration must be verified to be ±0.5 amu of the true value, by acquiring a full scan continuum mass spectrum of a PFAS.

No problems were found for this criterion.

5. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument can produce acceptable quantitative data. An initial calibration demonstrates that the instrument can give acceptable performance at the beginning of an experimental sequence. The continuing calibration checks document that the instrument is providing satisfactory daily performance. Additionally, a continuing calibration is analyzed at the end of each 12-hour analytical sequence, denoted as a "closing" calibration verification and ascertains acceptable performance at the conclusion of the analytical sequence.

A) Initial Calibration

Percent Relative Standard Deviation (%RSD) is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent RSD must be less than the maximum %RSD, in cases where linear and non-linear regressions are used, linear correlation coefficients must be greater than the minimum requirement. If the %RSD or correlation coefficient do not meet quality control criteria, detects may be qualified as "J" and professional judgement is used to qualify non-detects. Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion.

B) Continuing Calibration

Percent difference (%D) compares the response factor of the continuing calibration check to mean response factor (RF) from the initial calibration. The %D for all analytes and surrogates in the continuing calibration verifications (CCVs) must be <30%. A value outside of these limits indicates potential detection and quantitation errors. If the %D exceeds quality control criteria, the positive results are flagged as estimated, "J" and non-detects are flagged "UJ". Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion with the following exceptions. The recoveries for PFDoA were outside of acceptance limits for two calibration verifications associated with all samples in this sample delivery group (SDG). All results reported for the impacted analyte in the associated samples have been qualified "UJ" on this basis.

6. BLANKS

Quality assurance (QA) blanks (i.e. method, storage, trip, field, or rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation and analysis or field activity. Method and storage blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. Qualifications were applied to the samples and analytes as shown below.

A) Laboratory Blanks

Method blanks were analyzed with appropriate frequency. No problems were found for this criterion.

B) Equipment / Field Blanks

Sample SHAFT-FB-250408-25098-N was submitted as a field blank in association with this SDG. No problems were found for this criterion.

7. SURROGATES

All samples are spiked with isotopically labeled surrogate compounds prior to sample preparation and analyses to evaluate overall laboratory performance and efficiency of the analytical technique. The reported project samples and laboratory quality control samples had observed surrogate recoveries within the established limits in all cases with the following exceptions.

No problems requiring qualification of sample results were found for this criterion with the following exception. The observed recoveries for surrogates 13C2-PFHxA and d5-EtFOSAA were greater than the upper acceptable limit during the analysis of sample SHAFT-HW-0018394-25098-N. Positive results reported for the impacted sample have been qualified "J" on this basis.

8. INTERNAL STANDARDS PERFORMANCE

Internal standard performance criteria are meant to ensure that the liquid chromatograph/tandem mass spectrometer (LC/MS/MS) sensitivity and response are stable during every experimental run. The internal standard area count must not vary by more than +/- 50% from the average peak area calculated during the initial calibration and 70-140% from the most recent continuing calibration standard. The retention time of the internal standard must not vary by more than +/-30 seconds from the associated continuing calibration standard. If area count is greater than the upper acceptance limit, non-detected results are not qualified while positive results are qualified "J," estimated. When an observed area count is less than the lower acceptance limit, results are qualified "J" or "UJ" as appropriate.

No problems were found for this criterion.

9. COMPOUND IDENTIFICATION

Compound Identification

The project target analyte compounds are identified on the LC/MS/MS by using the analytes relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within ±0.06 RRT units of the standard compound and have ion spectra with primary and when available secondary characteristic ions present. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications.

Target compound identifications were reviewed for samples at the Stage 4 level. No anomalies were identified.

10. MATRIX SPIKE/MATRIX SPIKE DUPLICATE / MATRIX DUPLICATE

Matrix spike/matrix spike duplicate (MS/MSD) data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD data may be used in conjunction with other quality control criteria for additional qualification of data.

Sample SHAFT-HW-0018393-25098-N was submitted for MS evaluation in association with this SDG. Upon evaluation all accuracy indicators were acceptable with the following exception. The observed MS recoveries for PFTeDA was lower than the lowest acceptable limit. The result reported for the impacted analyte in the parent sample has been qualified "UJ" on this basis.

Sample SHAFT-HW-0018394-25098-N was submitted for matrix duplicate evaluation in association with this SDG. Upon evaluation adequate laboratory precision was demonstrated.

11. LABORATORY CONTROL SAMPLE

The Laboratory Control Sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Aqueous/water, soil/sediment, wipe, and filter LCSs shall be analyzed for each analyte utilizing the same sample preparations, analytical methods, and quality assurance/quality control (QA/QC) procedures as employed for the samples. All LCS percent recoveries must fall within the control limits. Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion with the following exceptions. The observed recovery for PFTrDA was less than the lowest acceptance limit in the LCS associated with all samples in this SDG. The results reported for the impacted analyte in the associated samples have been qualified "UJ" on this basis.

12. FIELD DUPLICATE

Field duplicates may be taken and analyzed as an indication of overall precision. These analyses measure both field and laboratory precision. A control limit of 30% for the Relative Percent Difference (RPD) shall be used for original and duplicate sample values greater than or equal to five times the LOQ. A control limit of two times the LOQ shall be used if either the sample or duplicate value is less than five times the LOQ. For field duplicate analyses that do not meet the technical criteria, the action was applied to only the field sample and its duplicate.

No samples were submitted as a field duplicate pair in association with this SDG.

13. DILUTIONS, RE-EXTRACTIONS & REANALYSIS

Samples may be re-analyzed for dilution, re-extraction and for other QC reasons. In such cases, the best result values are used.

Samples were re-extracted and/or reanalyzed in several cases to confirm quality control results. Upon review, the laboratory reported the best and final result.

14. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT

Overall, the laboratory data generated met the project goals and quality control criteria, with the exceptions identified in this report and as summarized in Table 1.

15. OTHER PROBLEMS

None.

SAMPLE RECEIPT AND CASE NARRATIVE REVIEW

- ✓ Traffic reports, chain-of-custody forms or SDG narrative do not indicate any problems with sample receipt, condition of the samples, analytical problems or special circumstances affecting the quality of the data.

  Coolers received on 04/09 at 5C

HOLDING TIMES

- ✓ Water and waste samples must be properly preserved (cooled to 4° +/- 2°), and samples must be extracted within 28 days of the date of collection. Extracts must be analyzed within 28 days of the date of extraction.

  Samples collected on 04/08
  Samples extracted on 04/10
  Samples analyzed on 04/11

  All ok

ISOTOPE DILUTION ANALOGUE

- ✓ LCMS Surrogate Recovery (Form II, Form VIII)
- ✓ Added to all QC and field samples
- ✓ Recoveries are within 50-200%
- ✓ See table 5 in method 533 for extracted internal standard associations

Per NFG:

- ✓ If low qualify J-/UJ
- ✓ If high qualify J+ for positive hits; no qual on ND
- ✓ If <10% qualify J-/R

All ok

LCMS LABORATORY CONTROL SAMPLE

- ✓ LCMS Lab Control Recovery (Form III), Form I, prep log, run log
- ✓ LCS prepared, extracted, analyzed, and reported once for every 20 field samples of a similar matrix, per SDG. Raw data and percent recoveries present for all Laboratory Control samples as required by Method 537 (Table 13).
- ✓ Laboratory Control Samples were analyzed for all the target analytes that the samples are analyzed for.
- ✓ Per method 533: Recoveries 70-130% for medium and high level lab fortified blank or 50-150% for low level lab fortified blank and 70-130 % per EPA 910-R-18-001 (11/2018)

OP8808-BS
All ok

MS/MSD

- ✓ LCMS Matrix Spike Recovery (Form III)
- ✓ The Matrix Spike Samples were spiked and analyzed for all the target analytes that the samples are analyzed for (Same analytes as LCS).
- ✓ Per method 533: Recoveries 70-130% for medium and high level lab fortified sample matrix or 50-150% for low level lab fortified sample matrix and 70-130 % per EPA 910-R-18-001 (11/2018)

- ✓ RPDs must be ≤ 30% and EPA 910-R-18-001 (11/2018)

SHAFT-HW-0018384-25098-N FC23797-1 MS only all ok

Lab Duplicate: SHAFT-HW-0018393-25098-N FC23797-2 all ok

BLANKS

- ✓ LCMS Method Blank Summary (Form IV), method blank Form I, prep log, run log
- ✓ Frequency of Analysis: reagent blank has been analyzed for every 20 (or less) samples of similar matrix or concentration or each extraction batch.
- ✓ Continuing Calibration Blanks (Form I) and run log
- ✓ Frequency of Analysis: immediately following the highest standard analyzed and daily prior to sample analysis.
- ✓ Field/rinse blanks are non-detected for all analytes

✓ evaluate storage, method, field and trip blanks

✓ method blank were prepared and analyzed in association with all samples in SDG

✓ and EPA 910-R-18-001 (11/2018):

Table 9. Blank Actions for PFAS Analysis

Blank Result	Sample Result	Action
Detect	Non-detect	No qualification
< MRL	< MRL	Report at MRL and qualify as non-detect (U)
	≥ 10x Blank Result	No qualification
≥ MRL	< MRL	Report at MRL and qualify as non-detect (U)
	≥ MRL and ≤ 10x Blank Result	Report at sample result and qualify as non-detect (U)
Gross contamination	Detect	Qualify as unusable (R)

OP8808-MB all ND

SHAFT-FB-250408-25098-N All ND

MASS CALIBRATION/TUNE CHECK

- ✓ Bracket ion masses of interest
- ✓ Verified to be ±0.5 amu of true value

passed

ICAL

- ✓ Initial Calibration Data Curve Evaluation (Form VI) and run log
- ✓ Minimum of 5 standard concentration were used
- ✓ %RSD <25% or r2 > 0.99

Note: An RSD value outside the initial calibration limit indicates the potential for quantitation errors. For this reason, all positive and non-detected results are qualified as estimated. Severe performance failures (RSD >90%) requires rejection of non-detected results.

See below

CCAL

- ✓ Continuing Calibration Data (Form VII) and run log
- ✓ Continuing calibration standard analyzed on each working day, prior to sample analyses.
- ✓ Calibration verification/continuing calibration standard been analyzed after every 10 samples and at the end of each analytical sequence
- ✓ The %D for all analytes and surrogates in the continuing calibration 70-130%

Used lab limit of 50% for CCVL

Instrument ID: GCMS3Q 04/11/25 all %RSD<25

MASS CALIBRATION/TUNE CHECK

- ✓ Bracket ion masses of interest
- ✓ Verified to be ±0.5 amu of true value

passed

ICAL

- ✓ Initial Calibration Data Curve Evaluation (Form VI) and run log
- ✓ Minimum of 5 standard concentration were used
- ✓ %RSD <25% or r2 > 0.99

Note: An RSD value outside the initial calibration limit indicates the potential for quantitation errors. For this reason, all positive and non-detected results are qualified as estimated. Severe performance failures (RSD >90%) requires rejection of non-detected results.

See below

CCAL

- ✓ Continuing Calibration Data (Form VII) and run log
- ✓ Continuing calibration standard analyzed on each working day, prior to sample analyses.
- ✓ Calibration verification/continuing calibration standard been analyzed after every 10 samples and at the end of each analytical sequence
- ✓ The %D for all analytes and surrogates in the continuing calibration 70-130%

Used lab limit of 50% for CCVL

Data Validation Report for FC23797

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S4VEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Extended Drinking Water Monitoring Plan, March 2024 and the Draft Database Management Plan December 2021, and in accordance with the EPA Drinking Water Methods, the National Functional Guidelines and Department of Defense Data Validation Guidelines as appropriate and in the order of priority listed. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by AECOM, Honolulu, HI; analyses were performed by (b) (4) and were reported under sample delivery group (SDG) FC23797. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Duplicate Error Ratio (LR)
- Extracted Internal Standard
- Field Blank
- Lab Blank
- Lab Replicate RPD
- LCS Recovery
- MS Recovery
- Prep Hold Time
- Relative Error Ratio (LR)
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 10 results (5.81%) out of the 172 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Analytical Method	Data Reviewer Comment
E533	No additional comments; see Checklist for detail.
E537.1	No additional comments; see Checklist for detail.

April 28, 2025

Reviewed by (b) (6), Technical Specialist, (b) (4).

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.

Quality Control Outliers for test method E533, Extracted Internal Standard

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with internal standards compounds prior to sample preparation (EIS). The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. EIS results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
SHAFT-HW-0018393-25098-N (LR)	Perfluoro-n-[1,2-13C2]dodecanoic acid (13C2-PFDoA)	46.00	50 - 200	50 - 200	percent	R/R	Y5	No Qualifiers Applied

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method E537.1, Extracted Internal Standard

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with internal standards compounds prior to sample preparation (EIS). The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. EIS results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
LABQC (BS)	d5-N-Ethylperfluoro-1-octanesulfonamido acetic acid	132.0	70 - 130	70 - 130	percent	R/R	Y5	No Qualifiers Applied
LABQC (LB)	d5-N-Ethylperfluoro-1-octanesulfonamido acetic acid	136.0	70 - 130	70 - 130	percent	R/R	Y5	No Qualifiers Applied

Quality Control Outliers for test method E537.1, Extracted Internal Standard

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with internal standards compounds prior to sample preparation (EIS). The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. EIS results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
SHAFT-HW-0018394-25098-N (N)	Perfluoro-n-[1,2-13C2]hexanoic acid (13C2-PFHxA)	133.0	70 - 130	70 - 130	percent	R/R	Y5	
SHAFT-HW-0018394-25098-N (LR)	Perfluoro-n-[1,2-13C2]hexanoic acid (13C2-PFHxA)	135.0	70 - 130	70 - 130	percent	R/R	Y5	No Qualifiers Applied
SHAFT-HW-0018394-25098-N (LR)	Tetrafluoro-2-heptafluoropropoxy-13C3-propanoic acid (13C3-HFPO-DA)	132.0	70 - 130	70 - 130	percent	R/R	Y5	No Qualifiers Applied

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method E537.1, Lab Replicate RPD

The objective of duplicate sample (LR) analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. Duplicate analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Laboratory duplicate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
SHAFT-HW-0018394-25098-N (LR)	Perfluorooctanesulfonic acid (PFOS)	200.0	< 30	< 30	rpd	R/R	D1	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method E537.1, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
OP8806-BS (BS)	Perfluorododecanoic acid (PFDoA)	57.00	70 - 130	40 - 130	percent	R/R	C	
OP8806-BS (BS)	Perfluorotetradecanoic acid (PFTeDA)	57.00	70 - 130	40 - 130	percent	R/R	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method E537.1, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
SHAFT-HW-0018393-25098-N (MS)	Perfluorododecanoic acid (PFDoA)	68.00	70 - 130	10 - 130	percent	R/R	M	
SHAFT-HW-0018393-25098-N (MS)	Perfluorotetradecanoic acid (PFTeDA)	34.00	70 - 130	10 - 130	percent	R/R	M	
SHAFT-HW-0018393-25098-N (MS)	Perfluorotridecanoic acid (PFTrDA)	60.00	70 - 130	10 - 130	percent	R/R	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for E537.1

FieldSample ID	Type	Analyte	RL	MDL	Lab Result	Qualified Result	Units	Reason
SHAFT-HW-0018393-25098-N FC23797-2A	N	Perfluorotetradecanoic acid (PFTeDA)	1.80	0.700	0.700 U	0.700 UJ	ng/l	M

Analytes not found in project samples are reported as not detected at the method detection limit (MDL) unless blank contamination occurs and then the sample may be reported as not detected at the (RL) or amount found in sample, whichever is greater. Results for PFAS analysis that are associated with blank contamination and are less than the RL will be reported non-detect at the sample concentration.

Table of All Qualified Results

Test Method: E537.1		Extraction Method: METHOD						
FieldSample ID / LabSample ID	Type	Analyte	RL	MDL	Lab Result	Qualified Result	Units	Reason
SHAFT-FB-250408-25098-N FC23797-4A	FB	Perfluorododecanoic acid (PFDoA)	1.90	0.740	0.740 U	0.740 UJ	ng/l	V1/V2

Analytes not found in project samples are reported as not detected at the method detection limit (MDL) unless blank contamination occurs and then the sample may be reported as not detected at the (RL) or amount found in sample, whichever is greater.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
C	LCS Recovery
I	Surrogate recovery outside project limits.
M	MS Recovery
TR	Trace Level Detect

Reason Code Definitions

Code	Definition
V1	ICV
V2	CCV

Flag Code and Definitions

Flag	Definition
J	Estimated Value
N	The analysis indicates the presence of an analyte for which there was presumptive evidence to make a tentative identification.
NJ	The analyte has been tentatively identified or presumptively as present and the associated numerical value was the estimated concentration in the sample.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
X	Result may require rejection; PDT attention required

Review Levels

S2AVEM	EPA Stage 2A Validation, Electronic Review supplemented with Manual Review by Chemist
S4VEM	EPA Stage 4 Validation, Electronic Review supplemented with Manual Review by Chemist

SAMPLE DELIVERY GROUP CASE NARRATIVE

2

Client: AECOM, INC. **Job No:** FC23899

Site: N6274224F0139 Extended Drinking Water **Report Date** 4/21/2025 11:55:21 A

On 04/12/2025, 3 Sample(s), 0 Trip Blank(s), 0 Equip. Blank(s) and 1 Field Blank(s) were received at (b) (4) [redacted] . at a maximum corrected temperature of 3 C. Samples were intact and chemically preserved, unless noted below. A (b) (4) [redacted] Job Number of FC23899 was assigned to the project.

Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section. Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

MS Semi-volatiles By Method EPA 533

Matrix: DW **Batch ID:** OP8883

- All samples were extracted within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) FC23899-1MS, FC23899-3DUP, FC23899-1MS were used as the QC samples indicated.
- Blank Spike Recovery(s) for 8:2 Fluorotelomer sulfonate, HFPO-DA (GenX), Perfluorododecanoic acid, Perfluoroheptanesulfonic acid, Perfluoroundecanoic acid are outside control limits.
- Matrix Spike Recovery(s) for 11Cl-PF3OUdS (F-53B Minor), 8:2 Fluorotelomer sulfonate, HFPO-DA (GenX), Perfluorododecanoic acid, Perfluoroundecanoic acid are outside control limits. Probable cause is due to matrix interference.
- Matrix Spike Recovery(s) for 11Cl-PF3OUdS (F-53B Minor), 8:2 Fluorotelomer sulfonate, HFPO-DA (GenX), Perfluorododecanoic acid, Perfluoroundecanoic acid are outside control limits. Probable cause is due to the ratio of spike to sample concentration < 4.
- Sample(s) FC23899-1, FC23899-2, FC23899-3, FC23899-4 have surrogates outside control limits.
- FC23899-1: Confirmation run.
- FC23899-3: Insufficient sample for re-extraction.
- FC23899-2: Insufficient sample for re-extraction.
- FC23899-2: Confirmation run.
- FC23899-4: Confirmation run.
- FC23899-1: Insufficient sample for re-extraction.
- FC23899-2 for Perfluoroundecanoic acid: Associated BS outside control limits high. Associated EIS outside control limits.
- FC23899-2 for Perfluorododecanoic acid: Associated EIS outside control limits. Associated BS outside control limits high.
- FC23899-3 for 8:2 Fluorotelomer sulfonate: Associated BS outside control limits high.
- FC23899-3 for Perfluorododecanoic acid: Associated BS outside control limits high. Associated EIS outside control limits.
- FC23899-1 for Perfluorododecanoic acid: Associated BS outside control limits high. Associated EIS outside control limits.
- FC23899-2 for 8:2 Fluorotelomer sulfonate: Associated BS outside control limits high.
- OP8883-BS for 13C2-PFDoDA: Outside control limits.
- FC23899-3 for 13C2-PFDoDA: Outside control limits.
- OP8883-BS for 13C2-PFDoDA: Outside control limits.
- OP8883-MB for 13C7-PFUnDA: Outside control limits.
- OP8883-MB for 13C2-PFDoDA: Outside control limits.
- OP8883-MB for 13C7-PFUnDA: Outside control limits.
- OP8883-MB for 13C2-PFDoDA: Outside control limits.

MS Semi-volatiles By Method EPA 533

Matrix: DW **Batch ID:** OP8907

- All samples were extracted within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- Sample(s) FC23948-1MS, FC23948-3DUP were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.
- Matrix Spike Recovery(s) for 11Cl-PF3OUdS (F-53B Minor) are outside control limits. Probable cause is due to matrix interference.
- Matrix Spike Recovery(s) for 11Cl-PF3OUdS (F-53B Minor) are outside control limits. Probable cause is due to the ratio of spike to sample concentration < 4.

MS Semi-volatiles By Method EPA 537.1 REV 2.0

Matrix: DW **Batch ID:** OP8882

- All samples were extracted within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- Sample(s) FC23899-1AMS, FC23899-3ADUP, FC23899-1AMS were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.
- Blank Spike Recovery(s) for 11Cl-PF3OUdS (F-53B Minor), 9Cl-PF3ONS (F-53B Major), EtFOSAA, MeFOSAA, Perfluorododecanoic acid, Perfluorotetradecanoic acid, Perfluorotridecanoic acid, Perfluoroundecanoic acid are outside control limits.
- Matrix Spike Recovery(s) for 11Cl-PF3OUdS (F-53B Minor), EtFOSAA, MeFOSAA, Perfluorododecanoic acid, Perfluorotetradecanoic acid, Perfluorotridecanoic acid, Perfluoroundecanoic acid are outside control limits. Probable cause is due to matrix interference.
- Matrix Spike Recovery(s) for 11Cl-PF3OUdS (F-53B Minor), EtFOSAA, MeFOSAA, Perfluorododecanoic acid, Perfluorotetradecanoic acid, Perfluorotridecanoic acid, Perfluoroundecanoic acid are outside control limits. Probable cause is due to the ratio of spike to sample concentration < 4.
- Sample(s) FC23899-1A, FC23899-2A, FC23899-3A, FC23899-4A have surrogates outside control limits.
- FC23899-2A: Sample received outside the holding time. Insufficient sample for re-extraction.
- FC23899-3A: Sample received outside the holding time. Confirmation run.
- FC23899-1A: Sample received outside the holding time. Insufficient sample for re-extraction.
- FC23899-1A: Sample received outside the holding time. Confirmation run.
- FC23899-3A: Sample received outside the holding time. Insufficient sample for re-extraction.
- FC23899-2A: Sample received outside the holding time. Confirmation run.
- FC23899-1A for Perfluorodecanoic acid: Associated ICV outside control limits high, however sample ND.
- FC23899-1A for EtFOSAA: Associated EIS outside control limits. Associated BS outside of control limits low.
- FC23899-2A for 11Cl-PF3OUdS (F-53B Minor): Associated BS outside of control limits low.
- FC23899-2A for Perfluorododecanoic acid: Associated BS outside of control limits low. Associated ICV outside control limits high.
- FC23899-3A for 11Cl-PF3OUdS (F-53B Minor): Associated BS outside of control limits low.
- FC23899-3A for Perfluorododecanoic acid: Associated BS outside of control limits low. Associated ICV outside control limits high.
- FC23899-1A for 11Cl-PF3OUdS (F-53B Minor): Associated BS outside of control limits low.
- FC23899-4A for 11Cl-PF3OUdS (F-53B Minor): Associated BS outside of control limits low.
- FC23899-4A for Perfluoroundecanoic acid: Associated BS outside of control limits low.
- FC23899-4A for Perfluorododecanoic acid: Associated BS outside of control limits low. Associated ICV outside control limits high.
- FC23899-4A for d5-NEtFOSAA: Outside control limits.
- OP8882-BS for d5-EtFOSAA: Outside control limits.
- FC23899-4A for Perfluorotridecanoic acid: Associated BS outside of control limits low.
- FC23899-4A for Perfluorotetradecanoic acid: Associated BS outside of control limits low.
- FC23899-4A for MeFOSAA: Associated BS outside of control limits low.
- FC23899-4A for 9Cl-PF3ONS (F-53B Major): Associated BS outside of control limits low.
- OP8882-MB for d5-EtFOSAA: Outside control limits.
- OP8882-BS for d5-EtFOSAA: Outside control limits.
- OP8882-MB for d5-EtFOSAA: Outside control limits.
- FC23899-4A for EtFOSAA: Associated BS outside of control limits low.

Matrix: DW **Batch ID:** OP8904

- Sample(s) FC23899-4A have surrogates outside control limits.

MS Semi-volatiles By Method EPA 537.1 REV 2.0

Matrix: DW **Batch ID:** OP8904

- FC23899-4A: Confirmation run.

(b) (4) certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting the Quality System precision, accuracy and completeness objectives except as noted. Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria. (b) (4) is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety.

CAS No.	Surrogate Recoveries	Run# 1	Run# 2	Limits
	13C2-PFHxA	102%	139% [d]	70-130%
	13C2-PFDA	80%	127%	70-130%
	d5-EtFOSAA	66% [d]	145% [d]	70-130%
	13C3-HFPO-DA	98%	130%	70-130%

U = Not detected LOD = Limit of Detection J = Indicates an estimated value
MCL = Maximum Contamination Level (40 CFR 141) B = Indicates analyte found in associated method blank
E = Indicates value exceeds calibration range N = Indicates presumptive evidence of a compound

Report of Analysis

Client Sample ID:	SHAFT-HW-0018394-25098-N-R01		
Lab Sample ID:	FC23899-4A	**Date Sampled:**	04/11/25
Matrix:	DW - Drinking Water	**Date Received:**	04/12/25
Method:	EPA 537.1 REV 2.0 EPA 537.1	**Percent Solids:**	n/a
Project:	N6274224F0139 Extended Drinking Water		

Perfluorinated Alkyl Acids

CAS No.	Compound	Result	MCL	LOQ	LOD	DL	Units	Q

(a) Confirmation run.
(b) Associated BS outside of control limits low.
(c) Associated BS outside of control limits low. Associated ICV outside control limits high.
(d) Outside control limits.

U = Not detected LOD = Limit of Detection
MCL = Maximum Contamination Level (40 CFR 141)
