EXECUTIVE NARRATIVE

Sample Delivery Group: FC23899
Laboratory: (b) (4)
Site: Red Hill Bulk Fuel Storage Facility, Joint Base Pearl Harbor-Hickam, Oahu, Hawaii, Extended Drinking Water Monitoring, NAH Shaft Treatment System Pilot Study
Sampling dates: 04/11/2025
Number of Samples: 4
Test Method: USEPA method 533
Analysis: Per-fluorinated Alkyl Substances (PFAS)

Quality Assurance Project Plan: Final Extended Drinking Water Monitoring Plan Joint Base Pearl Harbor-Hickam Public Water System #HI0000360 and Aliamanu Military Reservation PWS #HI0000337 O'ahu, Hawai'i, March 2024.

Validation Guidelines: Data Review and Validation Guidelines for Perfluoroalkyl Substances (PFASs) Analyzed Using EPA Method 537, EPA 910-R-18-001 (November 2018); National Functional Guidelines for High Resolution Superfund Methods Data Review, OLEM 9240.1-65, EPA-542-R-20-007, (November 2020).

Client Sample ID	Laboratory Sample ID	Matrix	Validation Stage
SHAFT-HW-0018384-25098-N-R01	FC23899-1	Drinking Water	S4VEM
SHAFT-FB-250411-25098-N	FC23899-2	Field blank	S4VEM
SHAFT-HW-0018393-25098-N-R01	FC23899-3	Drinking Water	S4VEM
SHAFT-HW-0018394-25098-N-R01	FC23899-4	Drinking Water	S4VEM

Table 1 provides a summary of the major and minor data quality issues identified in this data set. All data are acceptable except those results which have been qualified with "R", rejected. Data validation qualifiers along with associated descriptions are provided in Table 2. All data qualification related to this group of samples is detailed on the attached sheets.

All data users should note two facts. First, an "R" flag means that the associated value is unusable due to significant quality control (QC) problems, the data is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on any data tables even as a last resort. Second, no analyte concentration, even if it passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

DATA ASSESSMENT

1. NARRATIVE AND COMPLETENESS REVIEW

The case narrative was reviewed, and the data package was checked for completeness. No discrepancies were noted.

2. SAMPLE DELIVERY AND CONDITION

The samples arrived at the laboratory in acceptable condition. Proper custody was documented.

3. HOLDING TIME

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detect results will be flagged as not detected at an estimated quantitation limit, "UJ", unless the holding time is grossly exceeded (by more than two times the holding time specified), in which case non-detect results are flagged "R", rejected. Qualifications were applied to the samples and analytes as shown below.

All sample analyses were within the validation guidance.

4. MASS CALIBRATION

Mass calibration range must bracket the ion masses of interest. The most recent mass calibration must be used for every acquisition in an analytical run. Mass calibration must be verified to be ±0.5 amu of the true value, by acquiring a full scan continuum mass spectrum of a PFAS.

No problems were found for this criterion.

5. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument can produce acceptable quantitative data. An initial calibration demonstrates that the instrument can give acceptable performance at the beginning of an experimental sequence. The continuing calibration checks document that the instrument is providing satisfactory daily performance. Additionally, a continuing calibration is analyzed at the end of each 12-hour analytical sequence, denoted as a "closing" calibration verification and ascertains acceptable performance at the conclusion of the analytical sequence.

A) Initial Calibration

Percent Relative Standard Deviation (%RSD) is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent RSD must be less than the maximum %RSD, in cases where linear and non-linear regressions are used, linear correlation coefficients must be greater than the minimum requirement. If the %RSD or correlation coefficient do not meet quality control criteria, detects may be qualified as "J" and professional judgement is used to qualify non-detects. Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion.

B) Continuing Calibration

Percent difference (%D) compares the response factor of the continuing calibration check to mean response factor (RF) from the initial calibration. The %D for all analytes and surrogates in the continuing calibration verifications (CCVs) must be <30%. A value outside of these limits indicates potential detection and quantitation errors. If the %D exceeds quality control criteria, the positive results are flagged as estimated, "J" and non-detects are flagged "UJ". Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion.

6. BLANKS

Quality assurance (QA) blanks (i.e. method, storage, trip, field, or rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation and analysis or field activity. Method and storage blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. Qualifications were applied to the samples and analytes as shown below.

A) Laboratory Blanks

Method blanks were analyzed with appropriate frequency. No problems were found for this criterion.

B) Equipment / Field Blanks

Sample SHAFT-FB-250411-25098-N was submitted as a field blank in association with this sample delivery group (SDG). No problems were found for this criterion.

7. ISOTOPE DILUTION ANALOGUES

All samples are fortified with isotopically labeled analogues prior to sample preparation and analyses to evaluate overall laboratory performance and efficiency of the analytical technique. The reported project samples and laboratory quality control samples had observed isotope dilution analogue recoveries within the established limits in all cases with the following exceptions.

No problems were found for this criterion with the following exceptions.

The observed recoveries for isotope dilution standards 13C7-PFUnDA and 13C2-PFDoDA were less than the lowest acceptance limit during the analyses of samples SHAFT-HW-0018384-25098-N-R01, SHAFT-FB-250411-25098-N, and SHAFT-HW-0018393-25098-N-R01. The results reported for the associated target analytes have been qualified "UJ" on this basis.

8. COMPOUND IDENTIFICATION

Compound Identification

The project target analyte compounds are identified on the LC/MS/MS by using the analytes relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within ±0.06 RRT units of the standard compound and have ion spectra with primary and when available secondary characteristic ions present. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications.

Target compound identifications were reviewed for samples at the Stage 4 level. No anomalies were identified.

9. MATRIX SPIKE/MATRIX SPIKE DUPLICATE / MATRIX DUPLICATE

Matrix spike/matrix spike duplicate (MS/MSD) data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD data may be used in conjunction with other quality control criteria for additional qualification of data.

Sample SHAFT-HW-0018384-25098-N-R01 was submitted for MS evaluation in association with this SDG. Upon evaluation all accuracy indicators were acceptable or did not result in a need to qualify sample results with the following exception. The observed MS recovery for 11Cl-PF3OUdS was less than the lowest acceptance limit. The result reported for the impacted analyte in the parent sample has been qualified "UJ" on this basis.

Sample SHAFT-HW-0018393-25098-N-R01 was submitted for matrix duplicate evaluation in association with this SDG. Upon evaluation adequate laboratory precision was demonstrated.

10. LABORATORY CONTROL SAMPLE

The Laboratory Control Sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Aqueous/water, soil/sediment, wipe, and filter LCSs shall be analyzed for each analyte utilizing the same sample preparations, analytical methods, and quality assurance/quality control (QA/QC) procedures as employed for the samples. All LCS percent recoveries must fall within the control limits. Qualifications were applied to the samples and analytes as shown below.

No problems requiring qualification of samples results were found for this criterion.

11. FIELD DUPLICATE

Field duplicates may be taken and analyzed as an indication of overall precision. These analyses measure both field and laboratory precision. A control limit of 30% for the Relative Percent Difference (RPD) shall be used for original and duplicate sample values greater than or equal to five times the LOQ. A control limit of two times the LOQ shall be used if either the sample or duplicate value is less than five times the LOQ. For field duplicate analyses

that do not meet the technical criteria, the action was applied to only the field sample and its duplicate.

No samples were submitted as a field duplicate pair in association with this SDG.

12. DILUTIONS, RE-EXTRACTIONS & REANALYSIS

Samples may be re-analyzed for dilution, re-extraction and for other QC reasons. In such cases, the best result values are used.

Samples were re-extracted and/or reanalyzed in several cases to confirm quality control results. Upon review, the laboratory reported the best and final result.

13. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT

Overall, the laboratory data generated met the project goals and quality control criteria, with the exceptions identified in this report and as summarized in Table 1.

14. OTHER PROBLEMS

None.

Table 1 Major and Minor Findings

	Were acceptance criteria met?		
	Yes	No	
Per-fluorinated Compounds		Major	Minor
Holding Time/Sample Handling	x		
Method Blanks	x		
Equipment / Field Blanks	x		
Calibration Blanks	x		
Mass Calibration	x

Major = Major data quality issue identified resulting in rejection of data.
Minor = Minor data quality issue identified resulting in the qualification of data. Data qualification should be used to inform the data users of data limitations.
NA = Not applicable

Table 2 Data Validation Qualifiers

Data Qualifier	Definition
U	The analyte was analyzed for but was not detected above the level of the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

Table 1 provides a summary of the major and minor data quality issues identified in this data set. All data are acceptable except those results which have been qualified with "R", rejected. Data validation qualifiers along with associated descriptions are provided in Table 2. All data qualification related to this group of samples is detailed on the attached sheets.

All data users should note two facts. First, an "R" flag means that the associated value is unusable due to significant quality control (QC) problems, the data is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on any data tables even as a last resort. Second, no analyte concentration, even if it passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

DATA ASSESSMENT

1. NARRATIVE AND COMPLETENESS REVIEW

The case narrative was reviewed, and the data package was checked for completeness. No discrepancies were noted.

2. SAMPLE DELIVERY AND CONDITION

The samples arrived at the laboratory in acceptable condition. Proper custody was documented.

3. HOLDING TIME

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detect results will be flagged as not detected at an estimated quantitation limit, "UJ", unless the holding time is grossly exceeded (by more than two times the holding time specified), in which case non-detect results are flagged "R", rejected. Qualifications were applied to the samples and analytes as shown below.

All sample analyses were within the validation guidance.

4. MASS CALIBRATION

Mass calibration range must bracket the ion masses of interest. The most recent mass calibration must be used for every acquisition in an analytical run. Mass calibration must be verified to be ±0.5 amu of the true value, by acquiring a full scan continuum mass spectrum of a PFAS.

No problems were found for this criterion.

5. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument can produce acceptable quantitative data. An initial calibration demonstrates that the instrument can give acceptable performance at the beginning of an experimental sequence. The continuing calibration checks document that the instrument is providing satisfactory daily performance. Additionally, a continuing calibration is analyzed at the end of each 12-hour analytical sequence, denoted as a "closing" calibration verification and ascertains acceptable performance at the conclusion of the analytical sequence.

A) Initial Calibration

Percent Relative Standard Deviation (%RSD) is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent RSD must be less than the maximum %RSD, in cases where linear and non-linear regressions are used, linear correlation coefficients must be greater than the minimum requirement. If the %RSD or correlation coefficient do not meet quality control criteria, detects may be qualified as "J" and professional judgement is used to qualify non-detects. Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion.

B) Continuing Calibration

Percent difference (%D) compares the response factor of the continuing calibration check to mean response factor (RF) from the initial calibration. The %D for all analytes and surrogates in the continuing calibration verifications (CCVs) must be <30%. A value outside of these limits indicates potential detection and quantitation errors. If the %D exceeds quality control criteria, the positive results are flagged as estimated, "J" and non-detects are flagged "UJ". Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion with the following exceptions. The recoveries for PFDoA were outside of acceptance limits for two calibration verifications associated with all samples in this sample delivery group (SDG). All results reported for the impacted analyte in the associated samples have been qualified "UJ" on this basis.

6. BLANKS

Quality assurance (QA) blanks (i.e. method, storage, trip, field, or rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation and analysis or field activity. Method and storage blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. Qualifications were applied to the samples and analytes as shown below.

A) Laboratory Blanks

Method blanks were analyzed with appropriate frequency. No problems were found for this criterion.

B) Equipment / Field Blanks

Sample SHAFT-FB-250411-25098-N was submitted as a field blank in association with this SDG. No problems were found for this criterion.

7. SURROGATES

All samples are spiked with isotopically labeled surrogate compounds prior to sample preparation and analyses to evaluate overall laboratory performance and efficiency of the analytical technique. The reported project samples and laboratory quality control samples had observed surrogate recoveries within the established limits in all cases with the following exceptions.

No problems requiring qualification of sample results were found for this criterion with the following exception. The observed recoveries for surrogates d5-EtFOSAA were less than the lowest acceptable limit during the analyses of samples SHAFT-HW-0018384-25098-N-R01 and SHAFT-HW-0018394-25098-N-R01. All results reported for the impacted samples have been qualified "J" or "UJ" as appropriate on this basis.

8. INTERNAL STANDARDS PERFORMANCE

Internal standard performance criteria are meant to ensure that the liquid chromatograph/tandem mass spectrometer (LC/MS/MS) sensitivity and response are stable during every experimental run. The internal standard area count must not vary by more than +/- 50% from the average peak area calculated during the initial calibration and 70-140% from the most recent continuing calibration standard. The retention time of the internal standard must not vary by more than +/-30 seconds from the associated continuing calibration standard. If area count is greater than the upper acceptance limit, non-detected results are not qualified while positive results are qualified "J," estimated. When an observed area count is less than the lower acceptance limit, results are qualified "J" or "UJ" as appropriate.

No problems were found for this criterion.

9. COMPOUND IDENTIFICATION

Compound Identification

The project target analyte compounds are identified on the LC/MS/MS by using the analytes relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within ±0.06 RRT units of the standard compound and have ion spectra with primary and when available secondary characteristic ions present. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications.

Target compound identifications were reviewed for samples at the Stage 4 level. No anomalies were identified.

10. MATRIX SPIKE/MATRIX SPIKE DUPLICATE / MATRIX DUPLICATE

Matrix spike/matrix spike duplicate (MS/MSD) data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD data may be used in conjunction with other quality control criteria for additional qualification of data.

Sample SHAFT-HW-0018384-25098-N-R01 was submitted for MS evaluation in association with this SDG. Upon evaluation all accuracy indicators were acceptable with the following exceptions. The observed MS recoveries for the analytes listed in the table below were lower than the lowest acceptable limit. The results reported for the impacted analytes in the parent sample has been qualified "UJ" on this basis.

PFUnA	*PFTrDA*	*EtFOSAA*	*11Cl-PF3OUdS*
PFDoA	*PFTeDA*	*MeFOSAA*	

Sample SHAFT-HW-0018393-25098-N-R01 was submitted for matrix duplicate evaluation in association with this SDG. Upon evaluation adequate laboratory precision was demonstrated.

11. LABORATORY CONTROL SAMPLE

The Laboratory Control Sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Aqueous/water, soil/sediment, wipe, and filter LCSs shall be analyzed for each analyte utilizing the same sample preparations, analytical methods, and quality assurance/quality control (QA/QC) procedures as employed for the samples. All LCS percent recoveries must fall within the control limits. Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion with the following exceptions. The observed recoveries for the analytes listed in the table below were less than the lowest acceptance limit in the LCS associated with all samples in this SDG. The results reported for the impacted analytes in the associated samples have been qualified "UJ" on this basis.

PFUnA	*PFTrDA*	*EtFOSAA*	*9Cl-PF3ONS*
PFDoA	*PFTeDA*	*MeFOSAA*	*11Cl-PF3OUdS*

12. FIELD DUPLICATE

Field duplicates may be taken and analyzed as an indication of overall precision. These analyses measure both field and laboratory precision. A control limit of 30% for the Relative Percent Difference (RPD) shall be used for original and duplicate sample values greater than or equal to five times the LOQ. A control limit of two times the LOQ shall be used if either the sample or duplicate value is less than five times the LOQ. For field duplicate analyses that do not meet the technical criteria, the action was applied to only the field sample and its duplicate.

No samples were submitted as a field duplicate pair in association with this SDG.

13. DILUTIONS, RE-EXTRACTIONS & REANALYSIS

Samples may be re-analyzed for dilution, re-extraction and for other QC reasons. In such cases, the best result values are used.

Samples were re-extracted and/or reanalyzed in several cases to confirm quality control results. Upon review, the laboratory reported the best and final result.

14. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT

Overall, the laboratory data generated met the project goals and quality control criteria, with the exceptions identified in this report and as summarized in Table 1.

15. OTHER PROBLEMS

None.

Table 1 Major and Minor Findings

	Were acceptance criteria met?		
	Yes	No	
Per-fluorinated Compounds		Major	Minor
Holding Time/Sample Handling	x		
Method Blanks	x		
Equipment / Field Blanks	x		
Calibration Blanks	x		
Mass Calibration	x		
Calibration Percent Relative Standard Deviation and Percent Difference			x
Surrogates			x
Internal Standards Performance	x		
Compound Identification	x		
Matrix Spike/Matrix Spike Duplicate			x
Matrix Duplicate	x		
Laboratory Control Sample			x
Other Quality Control Data out of Specification	x		
Field Duplicate	NA		

Major = Major data quality issue identified resulting in rejection of data.
Minor = Minor data quality issue identified resulting in the qualification of data. Data qualification should be used to inform the data users of data limitations.
NA = Not applicable

Table 2 Data Validation Qualifiers

Data Qualifier	Definition
U	The analyte was analyzed for but was not detected above the level of the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

Table 3 PFAS Definitions Table

NO	CAS #	Target Name	Target Abbreviation
1	307-24-4	Perfluorohexanoic acid	PFHxA
2	375-85-9	Perfluoroheptanoic acid	PFHpA
3	335-67-1	Perfluorooctanoic acid	PFOA
4	375-95-1	Perfluorononanoic acid	PFNA
5	335-76-2	Perfluorodecanoic acid	PFDA
6	2058-94-8	Perfluoroundecanoic acid	PFUnDA
7	307-55-1	Perfluorododecanoic acid	PFDoA
8	72629-94-8	Perfluorotridecanoic acid	PFTrDA
9	376-06-7	Perfluorotetradecanoic acid	PFTeDA
10	375-73-5	Perfluorobutanesulfonic acid	PFBS
11	355-46-4	Perfluorohexanesulfonic acid	PFHxS

SAMPLE RECEIPT AND CASE NARRATIVE REVIEW

- ✓ Traffic reports, chain-of-custody forms or SDG narrative do not indicate any problems with sample receipt, condition of the samples, analytical problems or special circumstances affecting the quality of the data.

  Coolers received on 04/12 at 5C

HOLDING TIMES

- ✓ Water and waste samples must be properly preserved (cooled to 4° +/- 2°), and samples must be extracted within 28 days of the date of collection. Extracts must be analyzed within 28 days of the date of extraction.

  Samples collected on 04/11
  Samples extracted on 04/15 and 04/16
  Samples analyzed on 04/15 and 04/17

  All ok

ISOTOPE DILUTION ANALOGUE

- ✓ LCMS Surrogate Recovery (Form II, Form VIII)
- ✓ Added to all QC and field samples
- ✓ Recoveries are within 50-200%
- ✓ See table 5 in method 533 for extracted internal standard associations

Per NFG:

- ✓ If low qualify J-/UJ
- ✓ If high qualify J+ for positive hits; no qual on ND
- ✓ If <10% qualify J-/R

Data Validation Report for FC23899

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S4VEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Extended Drinking Water Monitoring Plan, March 2024 and the Draft Database Management Plan December 2021, and in accordance with the EPA Drinking Water Methods, the National Functional Guidelines and Department of Defense Data Validation Guidelines as appropriate and in the order of priority listed. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by AECOM, Honolulu, HI; analyses were performed by (b) (4) (b) (4) Orlando, FL and were reported under sample delivery group (SDG) FC23899. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Duplicate Error Ratio (LR)
- Extracted Internal Standard
- Field Blank
- Lab Blank
- Lab Replicate RPD
- LCS Recovery
- MS Recovery
- Prep Hold Time
- Relative Error Ratio (LR)
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 59 results (34.30%) out of the 172 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Analytical Method	Data Reviewer Comment
E533	No additional comments; see Checklist for detail.
E537.1	No additional comments; see Checklist for detail.

April 30, 2025

Reviewed by (b) (6), Technical Specialist, (b) (4).

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.

Quality Control Outliers for test method E533, Extracted Internal Standard

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with internal standards compounds prior to sample preparation (EIS). The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. EIS results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
LABQC (LB)	Perfluoro-n-[1,2,3,4,5,6,7-13C7]undecanoic acid (13C7-PFUnA)	45.00	50 - 200	50 - 200	percent	R/R	Y5	No Qualifiers Applied
LABQC (BS)	Perfluoro-n-[1,2-13C2]dodecanoic acid (13C2-PFDoA)	36.00	50 - 200	50 - 200	percent	R/R	Y5	No Qualifiers Applied
LABQC (LB)	Perfluoro-n-[1,2-13C2]dodecanoic acid (13C2-PFDoA)	34.00	50 - 200	50 - 200	percent	R/R	Y5	No Qualifiers Applied
SHAFT-FB-250411-25098-N (FB)	Perfluoro-n-[1,2,3,4,5,6,7-13C7]undecanoic acid (13C7-PFUnA)	40.00	50 - 200	50 - 200	percent	R/R	Y5	
SHAFT-FB-250411-25098-N (FB)	Perfluoro-n-[1,2-13C2]dodecanoic acid (13C2-PFDoA)	27.00	50 - 200	50 - 200	percent	R/R	Y5	
SHAFT-HW-0018384-25098-N-R01 (N)	Perfluoro-n-[1,2,3,4,5,6,7-13C7]undecanoic acid (13C7-PFUnA)	39.00	50 - 200	50 - 200	percent	R/R	Y5	
SHAFT-HW-0018384-25098-N-R01 (MS)	Perfluoro-n-[1,2,3,4,5,6,7-13C7]undecanoic acid (13C7-PFUnA)	40.00	50 - 200	50 - 200	percent	R/R	Y5	No Qualifiers Applied
SHAFT-HW-0018384-25098-N-R01 (N)	Perfluoro-n-[1,2-13C2]dodecanoic acid (13C2-PFDoA)	24.00	50 - 200	50 - 200	percent	R/R	Y5

Analytes not found in project samples are reported as not detected at the method detection limit (MDL) unless blank contamination occurs and then the sample may be reported as not detected at the (RL) or amount found in sample, whichever is greater. Results for PFAS analysis that are associated with blank contamination and are less than the RL will be reported non-detect at the sample concentration.

Quality Control Outliers for test method E533, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
OP8883-BS (BS)	8:2 Fluorotelomer sulfonic acid (8:2 FTS)	141.0	70 - 130	70 - 130	percent	R/R	C	
OP8883-BS (BS)	Hexafluoropropylene oxide dimer acid (HFPO-DA)	150.0	70 - 130	70 - 130	percent	R/R	C	
OP8883-BS (BS)	Perfluorododecanoic acid (PFDoA)	161.0	70 - 130	70 - 130	percent	R/R	C	
OP8883-BS (BS)	Perfluoroundecanoic acid (PFUnA)	136.0	70 - 130	70 - 130	percent	R/R	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Data Validation Report for FC23899

Quality Control Outliers for test method E533, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
SHAFT-HW-0018384-25098-N-R01 (MS)	11-Chloroeicosafluoro-3-oxaundecane-1-sulfonic acid (11Cl-PF3OUdS)	62.00	70 - 130	10 - 130	percent	R/R	M	
SHAFT-HW-0018384-25098-N-R01 (MS)	8:2 Fluorotelomer sulfonic acid (8:2 FTS)	139.0	70 - 130	10 - 130	percent	R/R	M	
SHAFT-HW-0018384-25098-N-R01 (MS)	Hexafluoropropylene oxide dimer acid (HFPO-DA)	135.0	70 - 130	10 - 130	percent	R/R	M	
SHAFT-HW-0018384-25098-N-R01 (MS)	Perfluorododecanoic acid (PFDoA)	168.0	70 - 130	10 - 130	percent	R/R	M	
SHAFT-HW-0018384-25098-N-R01 (MS)	Perfluoroundecanoic acid (PFUnA)	144.0	70 - 130	10 - 130	percent	R/R	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for E533

FieldSample ID	Type	Analyte	RL	MDL	Lab Result	Qualified Result	Units	Reason
SHAFT-HW-0018384-25098-N-R01 FC23899-1	N	11-Chloroeicosafluoro-3-oxaundecane-1-sulfonic acid (11Cl-PF3OUdS)	3.60	0.610	0.610 U	0.610 UJ	ng/l	M

Analytes not found in project samples are reported as not detected at the method detection limit (MDL) unless blank contamination occurs and then the sample may be reported as not detected at the (RL) or amount found in sample, whichever is greater. Results for PFAS analysis that are associated with blank contamination and are less than the RL will be reported non-detect at the sample concentration.

Quality Control Outliers for test method E537.1, Extracted Internal Standard

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with internal standards compounds prior to sample preparation (EIS). The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. EIS results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
LABQC (BS)	d5-N-Ethylperfluoro-1-octanesulfonamido acetic acid	43.00	70 - 130	70 - 130	percent	R/R	Y5	No Qualifiers Applied
LABQC (LB)	d5-N-Ethylperfluoro-1-octanesulfonamido acetic acid	53.00	70 - 130	70 - 130	percent	R/R	Y5	No Qualifiers Applied

Analytes not found in project samples are reported as not detected at the method detection limit (MDL) unless blank contamination occurs and then the sample may be reported as not detected at the (RL) or amount found in sample, whichever is greater. Results for PFAS analysis that are associated with blank contamination and are less than the RL will be reported non-detect at the sample concentration.

Quality Control Outliers for test method E537.1, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
SHAFT-HW-0018384-25098-N-R01 (MS)	11-Chloroeicosafluoro-3-oxaundecane-1-sulfonic acid (11Cl-PF3OUdS)	37.00	70 - 130	10 - 130	percent	R/R	M	
SHAFT-HW-0018384-25098-N-R01 (MS)	N-Ethyl perfluorooctanesulfonamidoacetic acid (NEtFOSAA)	60.00	70 - 130	10 - 130	percent	R/R	M	
SHAFT-HW-0018384-25098-N-R01 (MS)	N-Methyl perfluorooctanesulfonamidoacetic acid (NMeFOSAA)	59.00	70 - 130	10 - 130	percent	R/R	M	
SHAFT-HW-0018384-25098-N-R01 (MS)	Perfluorododecanoic acid (PFDoA)	33.00	70 - 130	10 - 130	percent	R/R	M	
SHAFT-HW-0018384-25098-N-R01 (MS)	Perfluorotetradecanoic acid (PFTeDA)	45.00	70 - 130	10 - 130	percent	R/R	M	
SHAFT-HW-0018384-25098-N-R01 (MS)	Perfluorotridecanoic acid (PFTrDA)	31.00	70 - 130	10 - 130	percent	R/R	M	
SHAFT-HW-0018384-25098-N-R01 (MS)	Perfluoroundecanoic acid (PFUnA)	54.00	70 - 130	10 - 130	percent	R/R	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the method detection limit (MDL) unless blank contamination occurs and then the sample may be reported as not detected at the (RL) or amount found in sample, whichever is greater.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Analytes not found in project samples are reported as not detected at the method detection limit (MDL) unless blank contamination occurs and then the sample may be reported as not detected at the (RL) or amount found in sample, whichever is greater.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
C	LCS Recovery
I	Surrogate recovery outside project limits.
M	MS Recovery
TR	Trace Level Detect
V1	ICV
Y5	Extracted Internal Standard

Flag Code and Definitions

Flag	Definition
J	Estimated Value
N	The analysis indicates the presence of an analyte for which there was presumptive evidence to make a tentative identification.
NJ	The analyte has been tentatively identified or presumptively as present and the associated numerical value was the estimated concentration in the sample.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

X	Result may require rejection; PDT attention required

Review Levels	
S2AVEM	EPA Stage 2A Validation, Electronic Review supplemented with Manual Review by Chemist
S4VEM	EPA Stage 4 Validation, Electronic Review supplemented with Manual Review by Chemist

SAMPLE DELIVERY GROUP CASE NARRATIVE

Client: AECOM, INC. **Job No:** FC23948

Site: N6274224F0139 Extended Drinking Water **Report Date:** 4/24/2025 1:37:51 PM

On 04/15/2025, 3 Sample(s), 0 Trip Blank(s), 0 Equip. Blank(s) and 1 Field Blank(s) were received at (b) (4) - Orlando. at a maximum corrected temperature of 4.4 C. Samples were intact and chemically preserved, unless noted below. A (b) (4) - Orlando Job Number of FC23948 was assigned to the project.

Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section. Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

MS Semi-volatiles By Method EPA 533

Matrix: DW **Batch ID:** OP8907

Sample(s) FC23948-1MS, FC23948-3DUP were used as the QC samples indicated.

Matrix Spike Recovery(s) for 11Cl-PF3OUdS (F-53B Minor) are outside control limits. Probable cause is due to matrix interference.

MS Semi-volatiles By Method EPA 537.1 REV 2.0

Matrix: DW **Batch ID:** OP8904

Sample(s) FC23948-3AMS, FC23948-4ADUP were used as the QC samples indicated.

Blank Spike Recovery(s) for Perfluorododecanoic acid, Perfluorotetradecanoic acid, Perfluorotridecanoic acid are outside control limits.

Matrix Spike Recovery(s) for Perfluorododecanoic acid, Perfluorotetradecanoic acid, Perfluorotridecanoic acid are outside control limits. Probable cause is due to matrix interference.

Sample(s) FC23948-1A, FC23948-2A, FC23948-3A, FC23948-4A have surrogates outside control limits.

OP8904-BS for 13C2-PFHxA: Outside control limits.

OP8904-BS for 13C3-HFPO-DA: Outside control limits.

OP8904-MB for 13C2-PFHxA: Outside control limits.

FC23948-1A for 13C2-PFHxA: Outside control limits.

FC23948-1A for 13C3-HFPO-DA: Outside control limits.

FC23948-1A for HFPO-DA (GenX): Associated EIS outside control limits.

FC23948-1A for Perfluorododecanoic acid: Associated BS outside of control limits low.

FC23948-1A for Perfluorotetradecanoic acid: Associated BS outside of control limits low.

FC23948-1A for Perfluorotridecanoic acid: Associated BS outside of control limits low.

FC23948-2A for Perfluorododecanoic acid: Associated BS outside of control limits low.

FC23948-2A: Confirmation run.

FC23948-2A: Insufficient sample for re-extraction.

FC23948-3A for EtFOSAA: Associated EIS outside control limits.

FC23948-3A for Perfluorotetradecanoic acid: Associated BS outside of control limits low.

FC23948-3A: Confirmation run.

FC23948-3A: Insufficient sample for re-extraction.

FC23948-4A for EtFOSAA: Associated EIS outside control limits.

FC23948-4A for Perfluorotetradecanoic acid: Associated BS outside of control limits low.

FC23948-4A: Confirmation run.

FC23948-4A: Insufficient sample for re-extraction.

Matrix: DW **Batch ID:** OP8985

FC23948-1A: Confirmation run.

(b) (4) - Orlando certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting the Quality System precision, accuracy and completeness objectives except as noted. Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria. (b) (4) (b) (4) .- Orlando is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety.

SAMPLE DELIVERY GROUP CASE NARRATIVE

Client: AECOM, INC. **Job No:** FC23948

Site: N6274224F0139 Extended Drinking Water **Report Date:** 4/24/2025 1:37:51 PM

On 04/15/2025, 3 Sample(s), 0 Trip Blank(s), 0 Equip. Blank(s) and 1 Field Blank(s) were received at (b) (4) at a maximum corrected temperature of 4.4 C. Samples were intact and chemically preserved, unless noted below. A (b) (4) Job Number of FC23948 was assigned to the project.

Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section. Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

MS Semi-volatiles By Method EPA 533

Matrix: DW **Batch ID:** OP8907

Sample(s) FC23948-1MS, FC23948-3DUP were used as the QC samples indicated.

Matrix Spike Recovery(s) for 11Cl-PF3OUdS (F-53B Minor) are outside control limits. Probable cause is due to matrix interference.

MS Semi-volatiles By Method EPA 537.1 REV 2.0

Matrix: DW **Batch ID:** OP8904

Sample(s) FC23948-3AMS, FC23948-4ADUP were used as the QC samples indicated.

Blank Spike Recovery(s) for Perfluorododecanoic acid, Perfluorotetradecanoic acid, Perfluorotridecanoic acid are outside control limits.

Matrix Spike Recovery(s) for Perfluorododecanoic acid, Perfluorotetradecanoic acid, Perfluorotridecanoic acid are outside control limits. Probable cause is due to matrix interference.

Sample(s) FC23948-1A, FC23948-2A, FC23948-3A, FC23948-4A have surrogates outside control limits.

OP8904-BS for 13C2-PFHxA: Outside control limits.

OP8904-BS for 13C3-HFPO-DA: Outside control limits.

OP8904-MB for 13C2-PFHxA: Outside control limits.

FC23948-1A for 13C2-PFHxA: Outside control limits.

FC23948-1A for 13C3-HFPO-DA: Outside control limits.

FC23948-1A for HFPO-DA (GenX): Associated EIS outside control limits.

FC23948-1A for Perfluorododecanoic acid: Associated BS outside of control limits low.

FC23948-1A for Perfluorotetradecanoic acid: Associated BS outside of control limits low.

FC23948-1A for Perfluorotridecanoic acid: Associated BS outside of control limits low.

FC23948-2A for Perfluorododecanoic acid: Associated BS outside of control limits low.

FC23948-2A: Confirmation run.

FC23948-2A: Insufficient sample for re-extraction.

FC23948-3A for EtFOSAA: Associated EIS outside control limits.

FC23948-3A for Perfluorotetradecanoic acid: Associated BS outside of control limits low.

FC23948-3A: Confirmation run.

FC23948-3A: Insufficient sample for re-extraction.

FC23948-4A for EtFOSAA: Associated EIS outside control limits.

FC23948-4A for Perfluorotetradecanoic acid: Associated BS outside of control limits low.

FC23948-4A: Confirmation run.

FC23948-4A: Insufficient sample for re-extraction.

Matrix: DW **Batch ID:** OP8985

FC23948-1A: Confirmation run.

(b) (4) certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting the Quality System precision, accuracy and completeness objectives except as noted. Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria. (b) (4) (b) (4) is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety.

Date / Time Received: 4/15/2025 3:00:00 PM **Delivery Method:** United Cargo/Airspace **Airbill #'s:** United Cargo AWB #: 016-93669413

Cooler Temps (Raw Measured) °C: Cooler 1: (4.0);

Cooler Temps (Corrected) °C: Cooler 1: (4.4);

Cooler Informatio	Y	or	N
1. Custody Seals Present:	☑		☐
2. Custody Seals Intact:	☑		☐
3. Temp criteria achieved:	☑		☐
4. Cooler temp verification:	IR Gun		
5. Cooler media:	Ice (Bag)		

Trip Blank Information	Y	or	N	N/A
1. Trip Blank present / cooler:	☐		☐	☑
2. Trip Blank listed on COC:	☐		☐	☑

	W	or	S	N/A
3. Type of TB Received	☐		☐	☑

Sample Information	Y	or	N	N/A
1. Sample labels present on bottles:	☑		☐	
2. Samples presented properly	☑		☐	
3. Sufficient volume/containers recv'd for analysi	☑		☐	
4. Condition of sample:	Intact			
5. Sample recv'd within HT	☑		☐	
6. Dates/Times/IDs on COC match sample labe	☑		☐	
7. VOCs have headspace	☐		☐	☑
8. Bottles received for unspecified tests	☐		☑	
9. Compositing instructions clear	☐		☐	☑
10. Voa Soil Kits/Jars received past 48hrs?	☐		☐	☑
11. % Solids Jar Received?	☐		☐	☑
12. Residual Chlorine Present?	☐		☐	☑

Misc Information

Number of Encores: 25 Gram 5 Gram

Test Strip Lot #s: pH 0-3: 226422 pH 10-12: Number of Lab Filtered Metals Other: (Specify) 0-14 210224

Residual Chlorine Test Strip Lot

Manual Integration Approval Summary

Sample Number:	S3Q1494-CC1492	**Method:**	EPA 533
Lab FileID:	3Q101533.D	**Analyst approved:**	04/18/25 08:08 (b) (6)
Injection Time:	04/17/25 14:20	**Supervisor approved:**	04/18/25 10:08 (b) (6)

Parameter	CAS	Sig#	R.T. (min.)	Reason
Perfluorohexanesulfonic acid	355-46-4		6.74	Split peak
Perfluorooctanesulfonic acid	1763-23-1		8.00	Split peak

QQQ Check Tune Report

Agilent | Trusted Answers

Instrument Name	LCMS-4Q
MS Model	G6470A
MS Instrument Serial	SG2004G105
Software_Firmware Version	10.1.67, FW: A.00.08.112
Tune Date & Time	21 April 2025 09:26:50
File Path	D:\MassHunter\Tune\QQQ\G6470A\atunes.TUNE.XML
Ion Source	AJS ESI
Ionization Mode	AJS ESI
Tuned Resolution	All
Vacuum Pressure	1.75E+0 [R] (Torr); 3.56E-5 [H] (Torr)

Source Parameters

Parameter	Negative
Gas Temp (°C)	300
Gas Flow (l/min)	8
Nebulizer (psi)	15
Capillary (V)	3500
Nozzle Voltage (V)	1500
Sheath Gas Temp (°C)	250
Sheath Gas Flow (l/min)	7

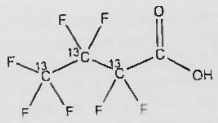
PRODUCT CODE:	M3PFBA	**LOT NUMBER:**	M3PFBA0124
COMPOUND:	Perfluoro-n-(2,3,4-$^{13}C_3$)butanoic acid		
		CAS #:	Not available

STRUCTURE:



MOLECULAR FORMULA:	$^{13}C_3{}^{2}CHF_7O_2$	**MOLECULAR WEIGHT:**	217.02
CONCENTRATION:	50.0 ± 2.5 µg/mL	**SOLVENT(S):**	Methanol Water (<1%)
CHEMICAL PURITY:	>98%	**ISOTOPIC PURITY:**	≥99% ^{13}C
LAST TESTED: (mm/dd/yyyy)	01/24/2024		
EXPIRY DATE: (mm/dd/yyyy)	01/24/2029		
RECOMMENDED STORAGE:	Store ampoule in a cool, dark place		

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acid to the methyl ester.
- Contains ~0.2% of perfluoro-n-($^{13}C_3$)propanoic acid, and also contains ~1.0% of perfluoro-n-($^{13}C_4$)butanoic acid (MPFBA) due to the naturally occurring isotopic abundance of ^{13}C in the unlabelled carbon atom.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

MPFAC-24ES

Mass-Labelled PFAS
Extraction Standard Solution

PRODUCT CODE:	MPFAC-24ES
LOT NUMBER:	MPFAC24ES0424
SOLVENT(S):	Methanol/Isopropanol (2%)/Water (<1%)
DATE PREPARED: (mm/dd/yyyy)	04/30/2024
LAST TESTED: (mm/dd/yyyy)	05/02/2024
EXPIRY DATE: (mm/dd/yyyy)	05/02/2029
RECOMMENDED STORAGE:	Refrigerate ampoule

DESCRIPTION:

MPFAC-24ES is a solution/mixture of mass-labelled (^{13}C) perfluoroalkylcarboxylic acids (C_4-C_{12} and C_{14}), mass-labelled (^{13}C) perfluoroalkanesulfonates (C_4, C_6, and C_8), mass-labelled (^{13}C) telomer sulfonates (4:2, 6:2, and 8:2), two mass-labelled (^{2}H) perfluorooctanesulfonamidoacetic acids, and perfluoro-1-($^{13}C_8$)octanesulfonamide. The components and their concentrations are given in Table A.

The individual ^{13}C-labelled perfluoroalkylcarboxylic acids, ^{13}C-labelled perfluoroalkanesulfonates, ^{13}C-labelled telomer sulfonates, and perfluoro-1-($^{13}C_8$)octanesulfonamide all have chemical purities of >98% and isotopic purities of ≥99%. The individual ^{2}H-labelled perfluorooctanesulfonamidoacetic acids all have chemical purities of >98% and isotopic purities of ≥98%.

DOCUMENTATION/ DATA ATTACHED:

Table A: Components and Concentrations of the Solution/Mixture
Figure 1: LC/MS Data (SIR)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acids to their respective methyl esters.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

CERTIFICATE OF ANALYSIS
DOCUMENTATION

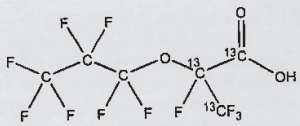
PRODUCT CODE: M3HFPO-DA
LOT NUMBER: M3HFPODA0824
COMPOUND: $^{13}C_3$-Hexafluoropropylene oxide dimer acid
IUPAC NAME: 2,3,3,3-Tetrafluoro-2-(1,1,2,2,3,3,3-heptafluoropropoxy)($^{13}C_3$)propanoic acid

STRUCTURE:
CAS #: 3030247-97-0



MOLECULAR FORMULA:	$^{13}C_3{}^{12}C_3HF_{11}O_3$	**MOLECULAR WEIGHT:**	333.03
CONCENTRATION:	50.0 ± 2.5 µg/mL	**SOLVENT(S):**	Methanol
CHEMICAL PURITY:	>98%	**ISOTOPIC PURITY:**	≥99% ^{13}C
LAST TESTED: (mm/dd/yyyy)	09/03/2024		
EXPIRY DATE: (mm/dd/yyyy)	09/03/2028		
RECOMMENDED STORAGE:	Refrigerate ampoule		

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- This product is commercially known as $^{13}C_3$-GenX.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Certified By: (b) (6) ger **Date:** 09/05/2024 (mm/dd/yyyy)

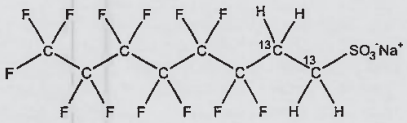
PRODUCT CODE:	M2-6:2FTS	**LOT NUMBER:**	M262FTS1122
COMPOUND:	Sodium 1H,1H,2H,2H-perfluoro-(1,2-$^{13}C_2$)octanesulfonate		
STRUCTURE:		**CAS #:**	2708218-89-5



MOLECULAR FORMULA:	$^{13}C_2{}^{12}C_6H_4F_{13}SO_3Na$	**MOLECULAR WEIGHT:**	452.13
CONCENTRATION:	50.0 ± 2.5 µg/mL (Na salt) 47.6 ± 2.4 µg/mL (M2-6:2FTS acid) 47.5 ± 2.4 µg/mL (M2-6:2FTS anion)	**SOLVENT(S):**	Methanol
CHEMICAL PURITY:	>98%	**ISOTOPIC PURITY:**	≥99% ^{13}C ($1,2\text{-}^{13}C_2$)
LAST TESTED: (mm/dd/yyyy)	11/24/2022		
EXPIRY DATE: (mm/dd/yyyy)	11/24/2027		
RECOMMENDED STORAGE:	Refrigerate ampoule		

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- The native 6:2FTS contains 4.22% of ^{34}S (due to natural isotopic abundance) therefore both native 6:2FTS and M2-6:2FTS will produce signals in the m/z 429 to m/z 409 channel during SRM analysis. We recommend using the m/z 429 to m/z 81 transition to monitor for M2-6:2FTS during quantitative analysis as it will be free of any native contribution (see Figure 2).

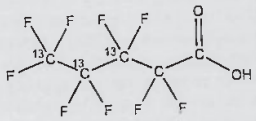
PRODUCT CODE: M3PFPeA
COMPOUND: Perfluoro-n-(3,4,5-$^{13}C_3$)pentanoic acid

LOT NUMBER: M3PFPeA0723

CAS #: Not available

STRUCTURE:



MOLECULAR FORMULA: $^{13}C_3{}^{12}C_2HF_9O_2$
CONCENTRATION: 50.0 ± 2.5 µg/mL

MOLECULAR WEIGHT: 267.02
SOLVENT(S): Methanol
Water (<1%)

CHEMICAL PURITY: >98%
LAST TESTED: (mm/dd/yyyy) 07/24/2023
EXPIRY DATE: (mm/dd/yyyy) 07/24/2028
RECOMMENDED STORAGE: Store ampoule in a cool, dark place

ISOTOPIC PURITY: ≥99% ^{13}C ($3,4,5$-$^{13}C_3$)

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acid to the methyl ester.
- Contains ~0.9% of perfluoro-n-($^{13}C_3$)butanoic acid (M3PFBA).

PFAC30PAR

Native Per- and Polyfluoroalkyl Substance
Precision and Recovery Standard Solution

PRODUCT CODE:	PFAC30PAR
LOT NUMBER:	PFAC301123
SOLVENT(S):	Methanol/Isopropanol (6%)/Water (<1%)
DATE PREPARED: (mm/dd/yyyy)	11/20/2023
LAST TESTED: (mm/dd/yyyy)	11/22/2023
EXPIRY DATE: (mm/dd/yyyy)	11/30/2026
RECOMMENDED STORAGE:	Refrigerate ampoule

DESCRIPTION:

PFAC30PAR is a solution/mixture of native linear perfluoroalkylcarboxylic acids (C_4-C_{14}), perfluoroalkanesulfonates (C_4, C_5, C_7, C_9, and C_{10} linear; C_6 and C_8 linear and branched), fluorotelomer sulfonates (4:2, 6:2, and 8:2), linear and branched perfluorooctanesulfonamidoacetic acids, perfluoroalkanesulfonamides (C_4, C_6, and C_8), sodium dodecafluoro-3H-4,8-dioxanonanoate (NaDONA), the major and minor components of F-53B (9Cl-PF3ONS and 11Cl-PF3OUdS), and hexafluoropropylene oxide dimer acid (GenX, HFPO-DA). The components and their concentrations are given in Table A.

The individual components all have chemical purities of >98%.

DOCUMENTATION/ DATA ATTACHED:

Table A: Components and Concentrations of the Solution/Mixture
Table B: Isomeric Components and Percent Composition of N-MeFOSAA
Table C: Isomeric Components and Percent Composition of N-EtFOSAA
Table D: Isomeric Components and Percent Composition of PFHxSK
Table E: Isomeric Components and Percent Composition of PFOSK
Figure 1: LC/MS Data (SIR)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acids to their respective methyl esters.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

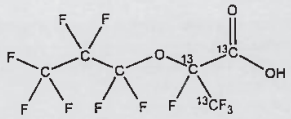
DOCUMENTATION

PRODUCT CODE:	M3HFPO-DA
COMPOUND:	$^{13}C_3$-Hexafluoropropylene oxide dimer acid
IUPAC NAME:	2,3,3,3-Tetrafluoro-2-(1,1,2,2,3,3,3-heptafluoropropoxy)($^{13}C_3$)propanoic acid
LOT NUMBER:	M3HFPODA0624
CAS #:	Not available

STRUCTURE:



MOLECULAR FORMULA:	$^{13}C_3{}^{12}C_3HF_{11}O_3$
CONCENTRATION:	50.0 ± 2.5 µg/mL
CHEMICAL PURITY:	>98%
LAST TESTED: (mm/dd/yyyy)	06/10/2024
EXPIRY DATE: (mm/dd/yyyy)	06/10/2027
RECOMMENDED STORAGE:	Refrigerate ampoule
MOLECULAR WEIGHT:	333.03
SOLVENT(S):	Methanol
ISOTOPIC PURITY:	≥99% ^{13}C

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- This product is commercially known as $^{13}C_3$-GenX.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

CONCENTRATION:	50.0 ± 2.5 µg/mL (Na salt) 47.6 ± 2.4 µg/mL (M2-6:2FTS acid) 47.5 ± 2.4 µg/mL (M2-6:2FTS anion)	**SOLVENT(S):**	Methanol
CHEMICAL PURITY:	>98%	**ISOTOPIC PURITY:**	≥99% ^{13}C ($1,2\text{-}^{13}C_2$)
LAST TESTED: (mm/dd/yyyy)	11/24/2022		
EXPIRY DATE: (mm/dd/yyyy)	11/24/2027		
RECOMMENDED STORAGE:	Refrigerate ampoule		

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- The native 6:2FTS contains 4.22% of ^{34}S (due to natural isotopic abundance) therefore both native 6:2FTS and M2-6:2FTS will produce signals in the m/z 429 to m/z 409 channel during SRM analysis. We recommend using the m/z 429 to m/z 81 transition to monitor for M2-6:2FTS during quantitative analysis as it will be free of any native contribution (see Figure 2).

PFAC30PAR

Native Per- and Polyfluoroalkyl Substance
Precision and Recovery Standard Solution

PRODUCT CODE:	PFAC30PAR
LOT NUMBER:	PFAC301123
SOLVENT(S):	Methanol/Isopropanol (6%)/Water (<1%)
DATE PREPARED: (mm/dd/yyyy)	11/20/2023
LAST TESTED: (mm/dd/yyyy)	11/22/2023
EXPIRY DATE: (mm/dd/yyyy)	11/30/2026
RECOMMENDED STORAGE:	Refrigerate ampoule

DESCRIPTION:

PFAC30PAR is a solution/mixture of native linear perfluoroalkylcarboxylic acids (C_4-C_{14}), perfluoroalkanesulfonates (C_4, C_5, C_7, C_9, and C_{10} linear; C_6 and C_8 linear and branched), fluorotelomer sulfonates (4:2, 6:2, and 8:2), linear and branched perfluorooctanesulfonamidoacetic acids, perfluoroalkanesulfonamides (C_4, C_6, and C_8), sodium dodecafluoro-3H-4,8-dioxanonanoate (NaDONA), the major and minor components of F-53B (9Cl-PF3ONS and 11Cl-PF3OUdS), and hexafluoropropylene oxide dimer acid (GenX, HFPO-DA). The components and their concentrations are given in Table A.

The individual components all have chemical purities of >98%.

DOCUMENTATION/ DATA ATTACHED:

Table A: Components and Concentrations of the Solution/Mixture
Table B: Isomeric Components and Percent Composition of N-MeFOSAA
Table C: Isomeric Components and Percent Composition of N-EtFOSAA
Table D: Isomeric Components and Percent Composition of PFHxSK
Table E: Isomeric Components and Percent Composition of PFOSK
Figure 1: LC/MS Data (SIR)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acids to their respective methyl esters.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

PRODUCT CODE:	M3HFPO-DA	**LOT NUMBER:**	M3HFPODA0624
COMPOUND:	$^{13}C_3$-Hexafluoropropylene oxide dimer acid		
IUPAC NAME:	2,3,3,3-Tetrafluoro-2-(1,1,2,2,3,3,3-heptafluoropropoxy)($^{13}C_3$)propanoic acid		
STRUCTURE:		**CAS #:**	Not available

MOLECULAR FORMULA:	$^{13}C_3{}^{12}C_3HF_{11}O_3$	**MOLECULAR WEIGHT:**	333.03
CONCENTRATION:	50.0 ± 2.5 µg/mL	**SOLVENT(S):**	Methanol
CHEMICAL PURITY:	>98%	**ISOTOPIC PURITY:**	≥99% ^{13}C
LAST TESTED: (mm/dd/yyyy)	06/10/2024		
EXPIRY DATE: (mm/dd/yyyy)	06/10/2027		
RECOMMENDED STORAGE:	Refrigerate ampoule		

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- This product is commercially known as $^{13}C_3$-GenX.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Certified By: (b) (6) **Date:** 06/11/2024 (mm/dd/yyyy)

CONCENTRATION:	50.0 ± 2.5 µg/mL (Na salt) 47.6 ± 2.4 µg/mL (M2-6:2FTS acid) 47.5 ± 2.4 µg/mL (M2-6:2FTS anion)	**SOLVENT(S):**	Methanol
CHEMICAL PURITY:	>98%	**ISOTOPIC PURITY:**	≥99% ^{13}C ($1,2\text{-}^{13}C_2$)
LAST TESTED: (mm/dd/yyyy)	11/24/2022		
EXPIRY DATE: (mm/dd/yyyy)	11/24/2027		
RECOMMENDED STORAGE:	Refrigerate ampoule		

DOCUMENTATION/ DATA ATTACHED:

Figure 1: LC/MS Data (Full Scan and Mass Spectrum)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- The native 6:2FTS contains 4.22% of ^{34}S (due to natural isotopic abundance) therefore both native 6:2FTS and M2-6:2FTS will produce signals in the m/z 429 to m/z 409 channel during SRM analysis. We recommend using the m/z 429 to m/z 81 transition to monitor for M2-6:2FTS during quantitative analysis as it will be free of any native contribution (see Figure 2).

PFAC30PAR

Native Per- and Polyfluoroalkyl Substance
Precision and Recovery Standard Solution

PRODUCT CODE:	PFAC30PAR
LOT NUMBER:	PFAC301123
SOLVENT(S):	Methanol/Isopropanol (6%)/Water (<1%)
DATE PREPARED: (mm/dd/yyyy)	11/20/2023
LAST TESTED: (mm/dd/yyyy)	11/22/2023
EXPIRY DATE: (mm/dd/yyyy)	11/30/2026
RECOMMENDED STORAGE:	Refrigerate ampoule

DESCRIPTION:

PFAC30PAR is a solution/mixture of native linear perfluoroalkylcarboxylic acids (C_4-C_{14}), perfluoroalkanesulfonates (C_4, C_5, C_7, C_9, and C_{10} linear; C_6 and C_8 linear and branched), fluorotelomer sulfonates (4:2, 6:2, and 8:2), linear and branched perfluorooctanesulfonamidoacetic acids, perfluoroalkanesulfonamides (C_4, C_6, and C_8), sodium dodecafluoro-3H-4,8-dioxanonanoate (NaDONA), the major and minor components of F-53B (9Cl-PF3ONS and 11Cl-PF3OUdS), and hexafluoropropylene oxide dimer acid (GenX, HFPO-DA). The components and their concentrations are given in Table A.

The individual components all have chemical purities of >98%.

DOCUMENTATION/ DATA ATTACHED:

Table A: Components and Concentrations of the Solution/Mixture
Table B: Isomeric Components and Percent Composition of N-MeFOSAA
Table C: Isomeric Components and Percent Composition of N-EtFOSAA
Table D: Isomeric Components and Percent Composition of PFHxSK
Table E: Isomeric Components and Percent Composition of PFOSK
Figure 1: LC/MS Data (SIR)
Figure 2: LC/MS/MS Data (Selected MRM Transitions)

ADDITIONAL INFORMATION:

- See page 2 for further details.
- Contains 4 mole eq. of NaOH to prevent conversion of the carboxylic acids to their respective methyl esters.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

EXECUTIVE NARRATIVE

Sample Delivery Group: FC23948
Laboratory: (b) (4)
Site: Red Hill Bulk Fuel Storage Facility, Joint Base Pearl Harbor-Hickam, Oahu, Hawaii, Extended Drinking Water Monitoring, NAH Shaft Treatment System Pilot Study
Sampling dates: 04/14/2025
Number of Samples: 4
Test Method: USEPA method 533
Analysis: Per-fluorinated Alkyl Substances (PFAS)

Quality Assurance Project Plan: Final Extended Drinking Water Monitoring Plan Joint Base Pearl Harbor-Hickam Public Water System #HI0000360 and Aliamanu Military Reservation PWS #HI0000337 O‘ahu, Hawai‘i, March 2024.

Validation Guidelines: Data Review and Validation Guidelines for Perfluoroalkyl Substances (PFASs) Analyzed Using EPA Method 537, EPA 910-R-18-001 (November 2018); National Functional Guidelines for High Resolution Superfund Methods Data Review, OLEM 9240.1-65, EPA-542-R-20-007, (November 2020).

Client Sample ID	Laboratory Sample ID	Matrix	Validation Stage
SHAFT-HW-0018384-25098-N-R02	FC23948-1	Drinking Water	S4VEM
SHAFT-FB-250414-25098-N	FC23948-2	Field blank	S4VEM
SHAFT-HW-0018393-25098-N-R02	FC23948-3	Drinking Water	S4VEM
SHAFT-HW-0018394-25098-N-R02	FC23948-4	Drinking Water	S4VEM

Table 1 provides a summary of the major and minor data quality issues identified in this data set. All data are acceptable except those results which have been qualified with “R”, rejected. Data validation qualifiers along with associated descriptions are provided in Table 2. All data qualification related to this group of samples is detailed on the attached sheets.

All data users should note two facts. First, an "R" flag means that the associated value is unusable due to significant quality control (QC) problems, the data is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on any data tables even as a last resort. Second, no analyte concentration, even if it passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

DATA ASSESSMENT

1. NARRATIVE AND COMPLETENESS REVIEW

The case narrative was reviewed, and the data package was checked for completeness. No discrepancies were noted.

2. SAMPLE DELIVERY AND CONDITION

The samples arrived at the laboratory in acceptable condition. Proper custody was documented.

3. HOLDING TIME

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detect results will be flagged as not detected at an estimated quantitation limit, "UJ", unless the holding time is grossly exceeded (by more than two times the holding time specified), in which case non-detect results are flagged "R", rejected. Qualifications were applied to the samples and analytes as shown below.

All sample analyses were within the validation guidance.

4. MASS CALIBRATION

Mass calibration range must bracket the ion masses of interest. The most recent mass calibration must be used for every acquisition in an analytical run. Mass calibration must be verified to be ±0.5 amu of the true value, by acquiring a full scan continuum mass spectrum of a PFAS.

No problems were found for this criterion.

5. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument can produce acceptable quantitative data. An initial calibration demonstrates that the instrument can give acceptable performance at the beginning of an experimental sequence. The continuing calibration checks document that the instrument is providing satisfactory daily performance. Additionally, a continuing calibration is analyzed at the end of each 12-hour analytical sequence, denoted as a "closing" calibration verification and ascertains acceptable performance at the conclusion of the analytical sequence.

A) Initial Calibration

Percent Relative Standard Deviation (%RSD) is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent RSD must be less than the maximum %RSD, in cases where linear and non-linear regressions are used, linear correlation coefficients must be greater than the minimum requirement. If the %RSD or correlation coefficient do not meet quality control criteria, detects may be qualified as "J" and professional judgement is used to qualify non-detects. Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion.

B) Continuing Calibration

Percent difference (%D) compares the response factor of the continuing calibration check to mean response factor (RF) from the initial calibration. The %D for all analytes and surrogates in the continuing calibration verifications (CCVs) must be <30%. A value outside of these limits indicates potential detection and quantitation errors. If the %D exceeds quality control criteria, the positive results are flagged as estimated, "J" and non-detects are flagged "UJ". Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion.

6. BLANKS

Quality assurance (QA) blanks (i.e. method, storage, trip, field, or rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation and analysis or field activity. Method and storage blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. Qualifications were applied to the samples and analytes as shown below.

A) Laboratory Blanks

Method blanks were analyzed with appropriate frequency. No problems were found for this criterion.

B) Equipment / Field Blanks

Sample SHAFT-FB-250414-25098-N was submitted as a field blank in association with this sample delivery group (SDG). No problems were found for this criterion.

7. ISOTOPE DILUTION ANALOGUES

All samples are fortified with isotopically labeled analogues prior to sample preparation and analyses to evaluate overall laboratory performance and efficiency of the analytical technique. The reported project samples and laboratory quality control samples had observed isotope dilution analogue recoveries within the established limits in all cases with the following exceptions.

No problems were found for this criterion.

8. COMPOUND IDENTIFICATION

Compound Identification

The project target analyte compounds are identified on the LC/MS/MS by using the analytes relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within ±0.06 RRT units of the standard compound and have ion spectra with primary and when available secondary characteristic ions present. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications.

Target compound identifications were reviewed for samples at the Stage 4 level. No anomalies were identified.

9. MATRIX SPIKE/MATRIX SPIKE DUPLICATE / MATRIX DUPLICATE

Matrix spike/matrix spike duplicate (MS/MSD) data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD data may be used in conjunction with other quality control criteria for additional qualification of data.

Sample SHAFT-HW-0018384-25098-N-R02 was submitted for MS evaluation in association with this SDG. Upon evaluation all accuracy indicators were acceptable or did not result in a need to qualify sample results with the following exception. The observed MS recoveries for PFDoA, PFUnA, and 11Cl-PF3OUdS were less than the lowest acceptance limit. The results reported for the impacted analytes in the parent sample have been qualified "J-" on this basis.

Sample SHAFT-HW-0018393-25098-N-R02 was submitted for matrix duplicate evaluation in association with this SDG. Upon evaluation adequate laboratory precision was demonstrated.

10. LABORATORY CONTROL SAMPLE

The Laboratory Control Sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Aqueous/water, soil/sediment, wipe, and filter LCSs shall be analyzed for each analyte utilizing the same sample preparations, analytical methods, and quality assurance/quality control (QA/QC) procedures as employed for the samples. All LCS percent recoveries must fall within the control limits. Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion.

11. FIELD DUPLICATE

Field duplicates may be taken and analyzed as an indication of overall precision. These analyses measure both field and laboratory precision. A control limit of 30% for the Relative Percent Difference (RPD) shall be used for original and duplicate sample values greater than or equal to five times the LOQ. A control limit of two times the LOQ shall be used if either the sample or duplicate value is less than five times the LOQ. For field duplicate analyses that do not meet the technical criteria, the action was applied to only the field sample and its duplicate.

No samples were submitted as a field duplicate pair in association with this SDG.

12. DILUTIONS, RE-EXTRACTIONS & REANALYSIS

Samples may be re-analyzed for dilution, re-extraction and for other QC reasons. In such cases, the best result values are used.

No sample re-extractions, reanalyses or dilutions were provided for data review.

13. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT

Overall, the laboratory data generated met the project goals and quality control criteria, with the exceptions identified in this report and as summarized in Table 1.

14. OTHER PROBLEMS

None.

Table 1 Major and Minor Findings

	Were acceptance criteria met?		
	Yes	No	
Per-fluorinated Compounds		Major	Minor
Holding Time/Sample Handling	x		
Method Blanks	x		
Equipment / Field Blanks	x		
Calibration Blanks	x		
Mass Calibration	x		
Calibration Percent Relative Standard Deviation and Percent Difference	x

Compound Identification	x		
Matrix Spike/Matrix Spike Duplicate			x
Matrix Duplicate	x		
Laboratory Control Sample	x		
Other Quality Control Data out of Specification	x		
Field Duplicate	NA		

Major = Major data quality issue identified resulting in rejection of data.
Minor = Minor data quality issue identified resulting in the qualification of data. Data qualification should be used to inform the data users of data limitations.
NA = Not applicable

Table 2 Data Validation Qualifiers

Data Qualifier	Definition
U	The analyte was analyzed for but was not detected above the level of the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

Table 3 PFAS Definitions Table

	CAS Number	Compound	Abbreviation(s)
1	151772-58-6	Nonafluoro-3,6-dioxaheptanoic acid	NFDHA, PFECA B

EXECUTIVE NARRATIVE

Sample Delivery Group: FC23948
Laboratory: [redacted]
Site: Red Hill Bulk Fuel Storage Facility, Joint Base Pearl Harbor-Hickam, Oahu, Hawaii, EPA Co-Sampling, Extended Drinking Water Monitoring, NAH Shaft Treatment System Pilot Study
Sampling dates: 04/14/2025
Number of Samples: 4
Test Method: USEPA method 537.1
Analysis: Per-fluorinated Alkyl Substances (PFAS)

Quality Assurance Project Plan: Final Extended Drinking Water Monitoring Plan Joint Base Pearl Harbor-Hickam Public Water System #HI0000360 and Aliamanu Military Reservation PWS #HI0000337 O‘ahu, Hawai‘i, March 2024.

Validation Guidelines: Data Review and Validation Guidelines for Perfluoroalkyl Substances (PFASs) Analyzed Using EPA Method 537, EPA 910-R-18-001 (November 2018).

Client Sample ID	Laboratory Sample ID	Matrix	Validation Stage
SHAFT-HW-0018384-25098-N-R02	FC23948-1A	Drinking Water	S4VEM
SHAFT-FB-250414-25098-N	FC23948-2A	Field blank	S4VEM
SHAFT-HW-0018393-25098-N-R02	FC23948-3A	Drinking Water	S4VEM
SHAFT-HW-0018394-25098-N-R02	FC23948-4A	Drinking Water	S4VEM

Table 1 provides a summary of the major and minor data quality issues identified in this data set. All data are acceptable except those results which have been qualified with “R”, rejected. Data validation qualifiers along with associated descriptions are provided in Table 2. All data qualification related to this group of samples is detailed on the attached sheets.

All data users should note two facts. First, an "R" flag means that the associated value is unusable due to significant quality control (QC) problems, the data is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on any data tables even as a last resort. Second, no analyte concentration, even if it passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

DATA ASSESSMENT

1. NARRATIVE AND COMPLETENESS REVIEW

The case narrative was reviewed, and the data package was checked for completeness. No discrepancies were noted.

2. SAMPLE DELIVERY AND CONDITION

The samples arrived at the laboratory in acceptable condition. Proper custody was documented.

3. HOLDING TIME

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detect results will be flagged as not detected at an estimated quantitation limit, "UJ", unless the holding time is grossly exceeded (by more than two times the holding time specified), in which case non-detect results are flagged "R", rejected. Qualifications were applied to the samples and analytes as shown below.

All sample analyses were within the validation guidance.

4. MASS CALIBRATION

Mass calibration range must bracket the ion masses of interest. The most recent mass calibration must be used for every acquisition in an analytical run. Mass calibration must be verified to be ±0.5 amu of the true value, by acquiring a full scan continuum mass spectrum of a PFAS.

No problems were found for this criterion.

5. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument can produce acceptable quantitative data. An initial calibration demonstrates that the instrument can give acceptable performance at the beginning of an experimental sequence. The continuing calibration checks document that the instrument is providing satisfactory daily performance. Additionally, a continuing calibration is analyzed at the end of each 12-hour analytical sequence, denoted as a "closing" calibration verification and ascertains acceptable performance at the conclusion of the analytical sequence.

A) Initial Calibration

Percent Relative Standard Deviation (%RSD) is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent RSD must be less than the maximum %RSD, in cases where linear and non-linear regressions are used, linear correlation coefficients must be greater than the minimum requirement. If the %RSD or correlation coefficient do not meet quality control criteria, detects may be qualified as "J" and professional judgement is used to qualify non-detects. Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion.

B) Continuing Calibration

Percent difference (%D) compares the response factor of the continuing calibration check to mean response factor (RF) from the initial calibration. The %D for all analytes and surrogates in the continuing calibration verifications (CCVs) must be <30%. A value outside of these limits indicates potential detection and quantitation errors. If the %D exceeds quality control criteria, the positive results are flagged as estimated, "J" and non-detects are flagged "UJ". Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion.

6. BLANKS

Quality assurance (QA) blanks (i.e. method, storage, trip, field, or rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation and analysis or field activity. Method and storage blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. Qualifications were applied to the samples and analytes as shown below.

A) Laboratory Blanks

Method blanks were analyzed with appropriate frequency. No problems were found for this criterion.

B) Equipment / Field Blanks

Sample SHAFT-FB-250414-25098-N was submitted as a field blank in association with this sample delivery group (SDG). No problems were found for this criterion.

7. SURROGATES

All samples are spiked with isotopically labeled surrogate compounds prior to sample preparation and analyses to evaluate overall laboratory performance and efficiency of the analytical technique. The reported project samples and laboratory quality control samples had observed surrogate recoveries within the established limits in all cases with the following exceptions.

No problems requiring qualification of sample results were found for this criterion with the following exception. The observed recoveries for surrogates 13C2-PFHxA and 13C3-HFPO-DA were greater than the upper acceptable limit during the analysis of sample SHAFT-HW-0018384-25098-N-R02. All positive results reported for the impacted sample have been qualified "J" on this basis.

8. INTERNAL STANDARDS PERFORMANCE

Internal standard performance criteria are meant to ensure that the liquid chromatograph/tandem mass spectrometer (LC/MS/MS) sensitivity and response are stable during every experimental run. The internal standard area count must not vary by more than +/- 50% from the average peak area calculated during the initial calibration and 70-140% from the most recent continuing calibration standard. The retention time of the internal standard must not vary by more than +/-30 seconds from the associated continuing calibration standard. If area count is greater than the upper acceptance limit, non-detected results are not qualified while positive results are qualified "J," estimated. When an observed area count is less than the lower acceptance limit, results are qualified "J" or "UJ" as appropriate.

No problems were found for this criterion.

9. COMPOUND IDENTIFICATION

Compound Identification

The project target analyte compounds are identified on the LC/MS/MS by using the analytes relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within ±0.06 RRT units of the standard compound and have ion spectra with primary and when available secondary characteristic ions present. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications.

Target compound identifications were reviewed for samples at the Stage 4 level. No anomalies were identified.

10. MATRIX SPIKE/MATRIX SPIKE DUPLICATE / MATRIX DUPLICATE

Matrix spike/matrix spike duplicate (MS/MSD) data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD data may be used in conjunction with other quality control criteria for additional qualification of data.

Sample SHAFT-HW-0018393-25098-N-R02 was submitted for MS evaluation in association with this SDG. Upon evaluation all accuracy indicators were acceptable with the following exceptions. The observed MS recoveries for PFDoA, PFTrDA, and PFTeDA were lower than the lowest acceptable limit. The results reported for the impacted analytes in the parent sample has been qualified "UJ" on this basis.

Sample SHAFT-HW-0018394-25098-N-R02 was submitted for matrix duplicate evaluation in association with this SDG. Upon evaluation adequate laboratory precision was demonstrated.

11. LABORATORY CONTROL SAMPLE

The Laboratory Control Sample (LCS) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Aqueous/water, soil/sediment, wipe, and filter LCSs shall be analyzed for each analyte utilizing the same sample preparations, analytical methods, and quality assurance/quality control (QA/QC) procedures as employed for the samples. All LCS percent recoveries must fall within the control limits. Qualifications were applied to the samples and analytes as shown below.

No problems were found for this criterion with the following exceptions. The observed recoveries for PFDoA, PFTrDA, and PFTeDA were less than the lowest acceptance limit in the LCS associated with all samples in this SDG. The results reported for the impacted analytes in the associated samples have been qualified "UJ" on this basis.

12. FIELD DUPLICATE

Field duplicates may be taken and analyzed as an indication of overall precision. These analyses measure both field and laboratory precision. A control limit of 30% for the Relative Percent Difference (RPD) shall be used for original and duplicate sample values greater than or equal to five times the LOQ. A control limit of two times the LOQ shall be used if either the sample or duplicate value is less than five times the LOQ. For field duplicate analyses that do not meet the technical criteria, the action was applied to only the field sample and its duplicate.

No samples were submitted as a field duplicate pair in association with this SDG.

13. DILUTIONS, RE-EXTRACTIONS & REANALYSIS

Samples may be re-analyzed for dilution, re-extraction and for other QC reasons. In such cases, the best result values are used.

Samples were re-extracted and/or reanalyzed in several cases to confirm quality control results. Upon review, the laboratory reported the best and final result.

14. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT

Overall, the laboratory data generated met the project goals and quality control criteria, with the exceptions identified in this report and as summarized in Table 1.

15. OTHER PROBLEMS

None.

Table 1 Major and Minor Findings

	Were acceptance criteria met?		
	Yes	No	
Per-fluorinated Compounds		Major	Minor
Holding Time/Sample Handling	x		
Method Blanks	x		
Equipment / Field Blanks	x		
Calibration Blanks	x		
Mass Calibration	x		
Calibration Percent Relative Standard Deviation and Percent Difference	x		
Surrogates			x

Laboratory Control Sample			x
Other Quality Control Data out of Specification	x		
Field Duplicate	NA		

Major = Major data quality issue identified resulting in rejection of data.
Minor = Minor data quality issue identified resulting in the qualification of data. Data qualification should be used to inform the data users of data limitations.
NA = Not applicable

Table 2 Data Validation Qualifiers

Data Qualifier	Definition
U	The analyte was analyzed for but was not detected above the level of the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

Table 3 PFAS Definitions Table

NO	CAS #	Target Name	Target Abbreviation
1	307-24-4	Perfluorohexanoic acid	PFHxA

Subject: [Non-DoD Source] NAHS Pilot Study - DOH Split Samples

Hi (b) (6)

Could you confirm that DOH was invited to oversee and given the option collect split samples, but they did not collect splits at the NAHS Pilot Study?

The highlighted section is what we're trying to confirm for the Tech Memo:

> 2.4 Pilot Study Approach
> The anticipated duration of the pilot study was 30 days. However, on day 24, the HI Department of Transportation (DOT) requested an emergency suspense to the pilot study's discharge operations in order to facilitate emergency repairs to downgrade

infrastructure below the adjacent freeway. Accordingly, the Navy suspended further operations, which prevented the remaining 6 days of the pilot study, including the final two sample events. After notification to and consultation with DOH, it was determined that sufficient samples had been collected to support conclusion of the pilot study. Over the 24-day pilot study period, 33 water samples were collected from three locations: prior to GAC treatment (raw water/influent), after the GAC vessels, and after the IX treatment (effluent). Additional quality control samples were collected, and DOH was invited to oversee sample collection activities and collect split samples for an independent check on accuracy. DOH did not collect any split samples.

Regards,

(b) (6)

Project Manager IV, US West Environment

Historical Results of NAHS Monitoring
Multiple Events
Chemistry Results
Drinking Water Sampling, JBPHH, Oahu, Hawaii

mg/L = Milligrams per Liter

CFU/100ml = Colony Forming Units per 100 Milliliters

MPN/ml = Most Probable Number per Milliliter

Fibers/L = Fibers per Liter

CFU/ml = Colony Forming Units per Milliliter

pg/L = Picograms per Liter

pCi/L = Picocuries per Liter

Drinking Water Sampling, JBPHH, Oahu, Hawaii

Location ID:	SHFTAIEA-PR-FW1
Location Type:	Faucet/Tap
Residence:	Aiea-Halawa Shaft Pre-Chlorination Spigot
Field Sample ID:	SHAFT-HW-0018363-24153-N
Sample Date:	2024-06-04
Sample Type:	N

Experimental PFAS (ng/L)	DOH Safe Drinking Water Branch (SDWB) Regulatory Constituents	Environmental Protection Agency Maximum Contaminant Levels	SDG: 320-112934-1
7H-Perfluoro-4-methyl-3,6-dioxaoctanesulfonic acid (Hydro-PS Acid)	None	None	0.430 U
Fluoro[perfluoro-2-(perfluoro-2-sulfoethoxy)propoxy]acetic acid (Hydrolyzed PSDA)	None	None	0.250 U
Perflouropropanoic acid (PFPrA)	None	None	**2.30 J**
Perfluoro-2-ethoxypropanoic acid (PEPA)	None	None	0.470 U
Perfluoro-2-methoxyacetic acid (PFMOAA)	None	None	0.400 U
Perfluoro-2-methoxypropanoic acid (PMPA)	None	None	0.340 U
Perfluoro-3,5,7,9,11-pentaoxadodecanoic acid (PFO5DA)	None	None	0.980 U
Perfluoro-3,5,7,9-butaoxadecanoic acid (PFO4DA)	None	None	0.400 U
Perfluoro-3,5,7-trioxaoctanoic acid (PFO3OA)	None	None	0.870 U
Perfluoro-3,5-dioxahexanoic acid (PFO2HxA)	None	None	0.540 U
Perfluoro-3,6-dioxa-4-methyl-7-octenesulfonic acid (PS Acid)	None	None	0.370 U
Perfluoro-4-(2-sulfoethoxy)pentanoic acid (R-PSDA)	None	None	0.260 U
Perfluoro-4-ethylcyclohexanesulfonic acid (PFECHSA)	None	None	0.440 U
Perfluoro-4-isopropoxybutanoic acid (PFPE-1)	None	None	0.280 U
Perfluorohexadecanoic acid	None	None	0.510 U
Perfluorooctadecanoic acid (PFODA)	None	None	0.590 U
Perfluoropropanesulfonic acid (PFPrS)	None	None	**0.440 J**
Tetrafluoro-3-(trifluoro-1-(trifluoromethyl)-2-((trifluorovinyl)oxy)ethoxy) propionic acid (EVE Acid)	None	None	0.370 U

Field Tests (mg/L)	DOH Safe Drinking Water Branch (SDWB) Regulatory Constituents	Environmental Protection Agency Maximum Contaminant Levels	
Free Chlorine	None	4	0.0400

Historical Results of NAHS Monitoring - PFAS
Multiple Events
Chemistry Results
Drinking Water Sampling, JBPHH, Oahu, Hawaii

Notes:

-- indicates that the sample was Not Analyzed for the analyte
Results in green font also exceed the DOH MCL
Results in blue font also exceed the EPA MCL
Results from G1/G3 sampling, where the G3 result is greater than the G1 result, have a red border and the associated G1/G3 result in parentheses for comparison

mg/L = Milligrams per Liter

µg/L = Micrograms per Liter

ng/L = Nanograms per Liter

Joint Base Pearl Harbor Hickam Drinking Water Issue - Drinking Water Results

Data Legend

Non-bold text indicates non-detected value

Bold text indicates detected value, but below the Department of Health (DOH) Environmental Action Level (EAL), DOH Maximum Contaminant Level (MCL), and EPA MCL.

Bold text indicates detected value, but below the Department of Health (DOH) Environmental Action Level (EAL), DOH Maximum Contaminant Level (MCL), and EPA MCL.
Bold and light orange shaded text indicates exceeds the DOH Tier 1 EAL.
Bold and orange shaded text indicates exceeds the DOH MCL.
Bold and blue shaded text indicates exceeds the EPA MCL.

Black text indicates preliminary laboratory results.

Blue text indicates results are laboratory final and undergoing third-party validation.

Green text indicates results have completed third-party validation.

[1]Pumps at Aiea-Halawa Pump Station were turned off on 3 Dec 21. Samples collected after the pumps were turned off are not representative of the Aiea-Halawa well water. Pre-chlorination samples were collected at the dead end of the distribution system.

— = not analyzed or not applicable

µg/L = microgram per liter (same as parts per billion

CAS = Chemical Abstracts Service

J = estimated value

J- = estimated value, low bias

J+ = estimated value, high bia

mg/L = milligram per lite

no. = number

Q = one or more quality control outside of acceptance criteri

QC = quality contro

U = nondetect value

UQ = nondetect value with one or more quality control outside of acceptance criteri

TB = trip blank. Do not count for total sample number. Only done for quality control purpose

TPH-g = total petroleum hydrocarbons-gasoline range organic

TPH-d = total petroleum hydrocarbons-diesel range organic

TPH-o = total petroleum hydrocarbons-residual range

EPA MCLs are included for reference only; the data were collected using SW-846 methods and not appropriate for comparison to MCLs.

P = Results Pending

D =

a = sample bottle for 200.8 was not received by la

b = 220.8 and 525.2 were not requested on the COC. Sample was recollected (see ERH4096

Wastewater Technology Fact Sheet

Granular Activated Carbon Adsorption and Regeneration

DESCRIPTION

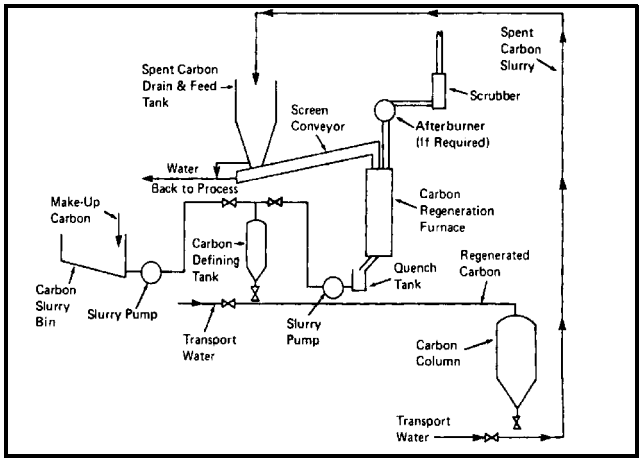
Granular activated carbon (GAC) adsorption has been used successfully for the advanced (tertiary) treatment of municipal and industrial wastewater. GAC is used to adsorb the relatively small quantities of soluble organics (See Table 1) and inorganic compounds such as nitrogen, sulfides, and heavy metals remaining in the wastewater following biological or physical-chemical treatment. Adsorption occurs when molecules adhere to the internal walls of pores in carbon particles produced by thermal activation.

TABLE 1 ORGANIC COMPOUNDS AMENABLE TO ADSORPTION BY GAC

Class	Example
Aromatic solvents	Benzene, toluene, xylene
Polynuclear aromatics	Naphthalene, biphenyl
Chlorinated aromatics	Chlorobenzene, PCBs, endrin, toxaphene, DDT
Phenolics	Phenol, cresol, resorcinol, nitrophenols, chlorophenols, alkyl phenols
Aromatic amines & high molecular weight aliphatic amines	Aniline, toluene diamine
Surfactants	Alkyl benzene sulfonates
Soluble organic dyes	Methylene blue, textiles, dyes
Fuels	Gasoline, kerosene, oil
Chlorinated solvents	Carbon tetrachloride, percholoroethylene
Aliphatic & aromatic acids	Tar acids, benzoic acids
Pesticides/herbicides	2,4-D, atrazine, simazine, aldicarb, alachlor, carbofuran

Source: U.S. EPA, 1984.

GAC systems are generally composed of carbon contactors, virgin and spent carbon storage, carbon transport systems, and carbon regeneration systems (See Figure 1). The carbon contactor consists of a lined steel column or a steel or concrete rectangular tank in which the carbon is placed to form a "filter" bed. A fixed bed downflow column contactor (See Figure 2) is often used to contact wastewater with GAC. Wastewater is applied at the top of the column, flows downward through the carbon bed, and is withdrawn at the bottom of the column. The carbon is held in place with an underdrain system at the bottom of the contactor. Provisions for backwash and surface wash of the carbon bed are required to prevent buildup of excessive headloss due to accumulation of solids and to prevent the bed surface from clogging.

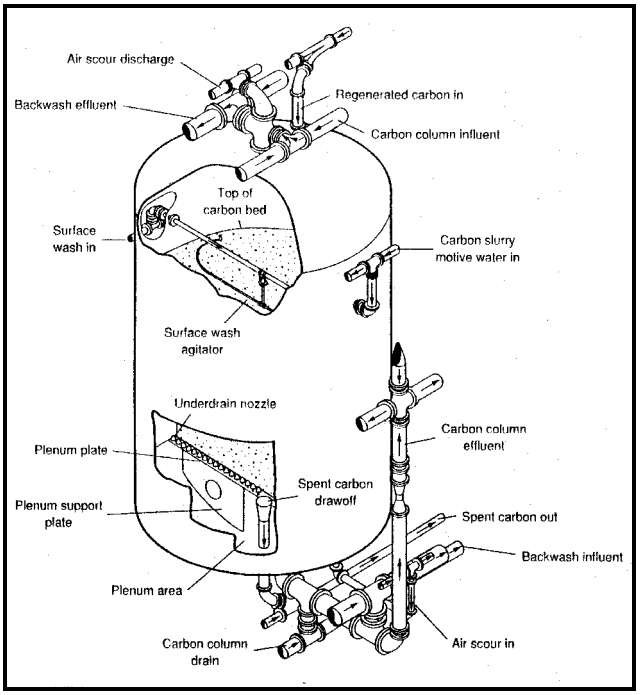


Source: WEF MOP 8, 1998.

FIGURE 1 GAC ADSORPTION SCHEMATIC

Expanded bed and moving bed carbon contactors have been developed to overcome problems associated with headloss buildup experienced with fixed bed downflow contactors. In an expanded bed system, wastewater is introduced at the bottom of the contactor and flows upward, expanding the carbon bed, much as the bed expands

during backwash of a fixed bed downflow contactor. In the moving bed system, spent carbon is replaced continuously so that the headloss does not build up. Carbon contactors may be operated under either pressure or gravity flow. The choice between pressure and gravity flow generally depends on the available pressure (head) within the wastewater treatment plant and cost.



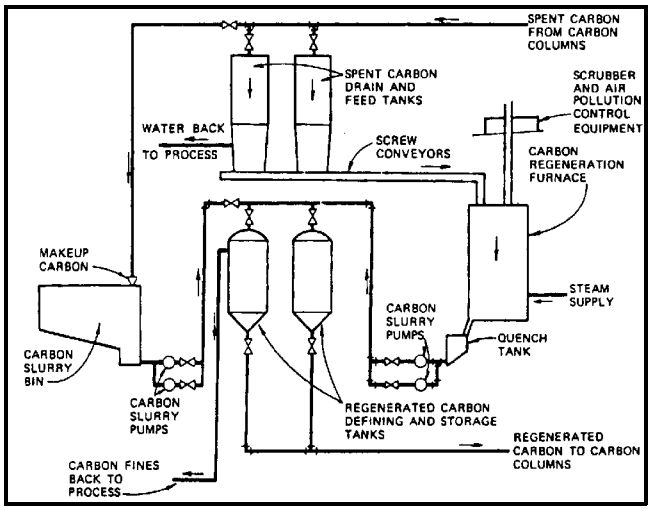
Source: Tchobanoglous and Burton, 1991.

FIGURE 2 TYPICAL DOWNFLOW CARBON CONTACTOR

All carbon contactors must be equipped with carbon removal and loading mechanisms to allow spent carbon to be removed and virgin or regenerated carbon to be added. Spent, regenerated, and virgin carbon is typically transported hydraulically by pumping as a slurry. Carbon slurries may be transported with water or compressed air, centrifugal or diaphragm pumps, or eductors.

When the carbon contactor effluent quality reaches minimum water quality standards, the spent carbon is removed from the contactor for regeneration. Small systems usually find regeneration of their spent carbon at an off-site commercial reactivation facility to be the most convenient and economical method. In this case, the spent carbon is hydraulically transported from the contactor to a waiting truck. Regenerated or virgin carbon is then hydraulically transported from a second truck or from a separate compartment in the first truck to the contactor, then to a commercial reactivation facility. Generally, systems which contain at least one million pounds of carbon find on-site regeneration to be cost effective.

Carbon regeneration is accomplished primarily by thermal means. Organic matter within the pores of the carbon is oxidized and thus removed from the carbon surface. The two most widely used regeneration methods are rotary kiln and multiple hearth furnaces. Approximately 5 to 10 percent of the carbon is destroyed in the regeneration process or lost during transport and must be replaced with virgin carbon. The capacity of the regenerated carbon is slightly less than that of virgin carbon. Repeated regeneration degrades the carbon particles until an equilibrium is eventually reached providing predictable long term system performance. See Figure 3 for a schematic of the carbon regeneration process.



Source: WEF MOP 8, 1998

FIGURE 3 REGENERATION SCHEMATIC

APPLICABILITY

Typically, GAC adsorption is utilized in wastewater treatment as a tertiary process following conventional secondary treatment or as one of several unit processes composing physical-chemical

treatment. In wastewater treatment plants utilizing biological secondary treatment, GAC adsorption is generally located after filtration and prior to disinfection. When utilized in a physical-chemical treatment process, GAC adsorption is generally located following chemical clarification and filtration and prior to disinfection. In addition, GAC adsorption systems have a relatively small footprint making them suitable for facilities with limited land availability.

The successful application of carbon adsorption for municipal wastewater treatment depends on the quality and quantity of the wastewater delivered to the adsorption system. For a carbon contactor to perform effectively, the feed water to the unit should be of uniform quality (suspended solids concentrations less than 20 mg/l) and without surges in flow. Wastewater constituents that may adversely affect carbon adsorption include suspended solids, BOD_5, and organics such as methylene blue active substances or phenol and dissolved oxygen. Environmental factors that must be considered include pH and temperature because they may impact solubility, which affects the adsorption properties of the wastewater components onto carbon (WEF MOP 8, 1998).

ADVANTAGES AND DISADVANTAGES

Before deciding whether carbon adsorption/regeneration meets the needs of a municipality, it is important to understand the advantages and disadvantages of both the adsorption and regeneration process.

Advantages (Adsorption)

- For wastewater flows which contain a significant quantity of industrial flow, GAC adsorption is a proven, reliable technology to remove dissolved organics.
- Space requirements are low.
- GAC adsorption can be easily incorporated into an existing wastewater treatment facility.

Advantages (Regeneration)

- Systems are reliable from a process standpoint.
- Reduces solid waste handling problems caused by the disposal of spent carbon.
- Saves up to 50 percent of the carbon cost.

Disadvantages (Adsorption)

- Under certain conditions, granular carbon beds may generate hydrogen sulfide from bacterial growth, creating odors and corrosion problems.
- Spent carbon, if not regenerated, may present a land disposal problem.
- Wet GAC is highly corrosive and abrasive.
- Requires pretreated wastewater with low suspended solids concentration. Variations in pH, temperature, and flow rate may also adversely affect GAC adsorption.

Disadvantages (Regeneration)

- Air emissions from the furnace contain volatiles stripped from the carbon. Carbon monoxide is formed as a result of incomplete combustion. Therefore, afterburners and scrubbers are usually needed to treat exhaust gases.
- The induced draft fan of a multiple hearth furnace may produce a noise problem.
- The process is most effective when operated on a 24-hour basis, requiring around-the-clock operator attention.
- The process is subject to more mechanical failures than other wastewater treatment processes.

DESIGN CRITERIA

Prior to the design of GAC systems, a pilot plant study should be performed to determine if the technology will meet discharge permit requirements and to quantify optimum flow rate, bed depth, and operating capacity on a particular wastewater. This information is required to determine the dimensions and number of carbon contactors required for continuous treatment.

The sizing of carbon contactors is based on contact time, hydraulic loading rate, carbon bed depth, and number of contactors. The carbon contact time typically ranges from 15 to 35 minutes depending on the application, wastewater constituents and desired effluent quality. Hydraulic loading rates of 4 to 10 gpm/sq.ft are typically used for upflow carbon columns. For downflow carbon columns, hydraulic loading rates of 3 to 5 gpm/sq.ft are used. Carbon bed depth varies typically within a range of 10 to 40 feet depending on carbon contact time (Tchobanoglous, 1991).

The number of contactors should be sufficient to ensure enough carbon contact time to maintain effluent quality while one column is off line during removal of spent carbon or maintenance. The normal practice is either to use two columns in series and rotate them as they become exhausted or to use multiple columns in parallel so that when one column becomes exhausted, the effluent quality will not be significantly affected (WEF MOP 8, 1998).

Regeneration facilities are typically sized based on carbon dosage or use rate. The dosage rate depends on the strength of the wastewater applied to the carbon and the required effluent quality. Typical dosage rates for filtered, secondary effluent range from 400 to 600 lbs/mil.gall., while typical dosage rates for coagulated, settled and filtered raw wastewater (physical-chemical) range from 600 to 1800 lbs/mil.gall.

PERFORMANCE

Niagara Falls Wastewater Treatment Plant Niagara Falls, New York

The Niagara Falls Wastewater Treatment Plant (NFWTP) has been operating as a physical-chemical activated carbon secondary treatment facility since 1985. With a design average daily flow capacity of 48 mgd, it is the largest municipal physical-chemical activated carbon wastewater treatment plant in operation in the United States. The treatment process consists of chemically assisted primary sedimentation, granular activated carbon adsorption, oxidation, and disinfection. The influent pH can be adjusted to compensate for industrial discharge. The current average daily flow is 35 mgd. Industrial flow to the plant is approximately 17 percent of the total flow.

The activated carbon system at NFWTP includes 28 carbon beds which are 17.3 feet wide by 42 feet long. Each carbon bed is approximately 8.5 feet in depth and contains 180,000 pounds of carbon. Primary effluent percolates downward by gravity through the GAC bed. Each carbon bed provides chemical adsorption of pollutants from the wastewater, physical filtration of solids, and biological degradation from the incidental anaerobic activity that occurs within.

The carbon beds at NFWTP operate in parallel. During dry weather, there are typically 17 carbon beds in operation with a primary effluent application rate of approximately 2.2 gpm/sq.ft. During wet weather, additional beds are placed in operation. All beds are operated at an application rate of approximately 3gpm/sq.ft (Roll, 1996). Backwash of the carbon beds is based on headloss.

Regeneration of the spent carbon is performed on-site in a multiple hearth furnace. Each filter bed is separately removed from service and emptied of carbon. The carbon is fed to the furnace at a rate of about 2,000 lbs/hr. The regenerated carbon is kept in storage until an empty bed becomes available. Normal operating losses, which average 5.5 percent, require the addition of virgin carbon to maintain inventory levels. At present, the four month regeneration process to regenerate all of the carbon is performed once per year.

Three storage tanks are used during on-site regeneration. The spent carbon storage tank has a capacity of 2.5 carbon beds; the regenerated carbon

storage tank can hold 1.5 beds of carbon and the virgin carbon storage tank has a capacity of 1 carbon bed. Carbon is moved about the plant in a slurry through an eductor system.

With GAC adsorption, the NFWTP has achieved very low effluent organic compound concentrations. On a daily basis, the facility receives approximately 800 pounds of influent priority pollutants which are reduced by the treatment process to 12 pounds in the effluent to the Niagara River. The effluent discharge permit issued to NFWTP by the New York State Department of Environmental Conservation includes effluent limitations for volatile compounds, acid compounds, base/neutral compounds, pesticides, metals, and cyanide.

Millard H. Robbins Reclamation Facility, Upper Occoquan Sewerage Authority, Centreville, Virginia

The Millard H. Robbins Reclamation Facility (MHRRF) provides biological, tertiary treatment to an average daily wastewater flow of 24 mgd. Industrial flow to the plant is approximately 10 percent of the total flow. The treatment process consists of primary sedimentation, conventional activated sludge with nitrification, lime addition for phosphorous removal, clarification, two-stage recarbonization, flow equalization, multimedia filtration, GAC adsorption, post filtration and disinfection. The MHRRF discharges its effluent to Bull Run which flows into the Occoquan Reservoir. This reservoir serves as raw water storage for the potable water supply to portions of northern Virginia.

The activated carbon system at MHRRF includes 32 upflow carbon columns which are 10 feet in diameter and 40 feet tall. Each column has a capacity of 1mgd and contains approximately 75,000 pounds of carbon. Flow is pumped through the columns by a pump station which also serves the multimedia filters and post filtration system. Post filtration is provided following the GAC columns to remove carbon fines from the effluent to maintain the Virginia Pollutant Discharge Elimination System (VPDES) permit requirement for turbidity of 0.5 NTU.

The carbon columns at MHRRF are operated in parallel. During average daily flow periods, approximately 24 columns are in operation with the remaining eight columns brought on line during daily peak flow periods. During wet weather, flows in excess of 32 mgd are stored in a 90 million gallon pond.

Regeneration of the spent carbon is performed on-site in a multiple hearth furnace. The regeneration process takes approximately 8 to 10 weeks to regenerate approximately one-third of the carbon in all 32 columns and is performed twice each year. Consequently, it takes approximately 18 months (three regeneration cycles) to regenerate the total quantity of carbon in the columns. Spent carbon is removed from the bottom of each column and transported to the regeneration furnace through an eductor system. The regenerated carbon is then added at the top of each column. The cost for on-site regeneration at MHRRF is approximately $0.35 per pound. Normal operating losses, which average 5 to 7 percent of the total quantity of GAC in use, require the addition of virgin carbon to maintain inventory levels. Most of the carbon attrition occurs during regeneration with approximately 10 to 12 percent of the total carbon regenerated lost during the regeneration process. Carbon is moved about the plant in a slurry through an eductor system.

GAC adsorption is utilized at MHRRF to remove non-biodegradable, soluble organics. COD is used as the surrogate indicator of non-biodegradable organics removal by the GAC columns. Currently, the Virginia Pollutant Discharge Elimination System (VPDES) discharge permit limit for COD is 10 mg/l. Following GAC regeneration, effluent COD concentrations range from 6 to 7 mg/l, which corresponds to approximately 50 percent removal of COD. As the GAC in the columns becomes exhausted, the percentage removal of COD declines to approximately 25 percent. When the effluent COD concentration has increased to 9 mg/l, GAC regeneration is initiated.

OPERATION AND MAINTENANCE

The proper operation and maintenance of GAC adsorption and regeneration systems ensures the

efficient removal of soluble organics from secondary effluent. A routine O&M schedule following manufacturer's recommendations should be developed and implemented for any GAC adsorption and regeneration system. Regular O&M includes the following:

- Backwash of carbon contactor based on headloss or flow.
- Flush carbon transport piping to prevent clogging.
- Backwash frequently after loading carbon to minimize clogging of backwash nozzles by carbon fines.
- Store an adequate supply of spent carbon to allow continuous operation of the regeneration furnace.
- Test and calibrate instrumentation and controls on a routine basis.

COSTS

The construction and operation and maintenance costs of carbon adsorption and regeneration depend on the characteristics of the wastewater to be treated, the capacity of the plant, and the plant site. Therefore, the designer is responsible for selecting a system that will meet the National Pollutant Discharge Elimination System NPDES permit requirements at the lowest cost possible. Once the optimum flow rate, bed depth, and operating capacity of GAC for a particular wastewater are determined, comparative costs for different carbon contactor configurations and the cost of on-site regeneration versus off-site regeneration can be estimated. Following a thorough engineering and economic analysis of alternatives, the final equipment configuration can be selected.

Construction costs include the carbon contactors, carbon transport system, carbon storage tanks, carbon regeneration system (if applicable), influent wastewater pumps (if applicable) and contactor backwash system. Operation and maintenance costs include the purchase of virgin carbon, on-site regeneration or purchase of regenerated carbon, electrical power to operate pumps and controls, flushing of carbon slurry piping, and replacement of parts. Currently, the cost of virgin carbon ranges from $0.70 to $1.20 per pound and the cost to purchase regenerated carbon ranges from $0.50 to $0.78 per pound.

Operational costs depend on the characteristics of the influent wastewater and the adsorption capacity of the GAC. For example, influent wastewater which contains suspended solids concentrations greater than 20 mg/l will require more frequent backwashing of the contactor to prevent clogging of the carbon bed.

Engineering Bulletin
Granular Activated Carbon Treatment

Purpose

Section 121(b) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) mandates the Environmental Protection Agency (EPA) to select remedies that "utilize permanent solutions and alternative treatment technologies or resource recovery technologies to the maximum extent practicable" and to prefer remedial actions in which treatment "permanently and significantly reduces the volume, toxicity, or mobility of hazardous substances, pollutants, and contaminants as a principal element." The Engineering Bulletins are a series of documents that summarize the latest information available on selected treatment and site remediation technologies and related issues. They provide summaries of and references for the latest information to help remedial project managers, on-scene coordinators, contractors, and other site cleanup managers understand the type of data and site characteristics needed to evaluate a technology for potential applicability to their Superfund or other hazardous waste site. Those documents that describe individual treatment technologies focus on remedial investigation scoping needs. Addenda will be issued periodically to update the original bulletins.

Abstract

Granular activated carbon (GAC) treatment is a physicochemical process that removes a wide variety of contaminants by adsorbing them from liquid and gas streams [1, p. 6-3]. This treatment is most commonly used to separate organic contaminants from water or air; however, it can be used to remove a limited number of inorganic contaminants [2, p. 5-17]. In most cases, the contaminants are collected in concentrated form on the GAC, and further treatment is required.

The contaminant (adsorbate) adsorbs to the surfaces of the microporous carbon granules until the GAC becomes exhausted. The GAC may then be either reactivated, regenerated, or discarded. The reactivation process destroys most contaminants. In some cases, spent GAC can be regenerated, typically using steam to desorb and collect concentrated contaminants for further treatment. If GAC is to be discarded, it may have to be handled as a hazardous waste.

Site-specific treatability studies are generally necessary to document the applicability and potential performance of a GAC system. This bulletin provides information on the technology applicability, technology limitations, a technology description, the types of residuals produced, site requirements, latest performance data, status of the technology, and sources for further information.

Technology Applicability

Adsorption by activated carbon has a long history of use as a treatment for municipal, industrial, and hazardous waste streams. The concepts, theory, and engineering aspects of the technology are well developed [3]. It is a proven technology with documented performance data. GAC is a relatively nonspecific adsorbent and is effective for removing many organic and some inorganic contaminants from liquid and gaseous streams [4].

The effectiveness of GAC as an adsorbent for general contaminant groups is shown in Table 1. Examples of constituents within contaminant groups are provided in "Technology Screening Guide for Treatment of CERCLA Soils and Sludges" [5]. This table is based on current available information or professional judgment when no information was available. The proven effectiveness of the technology for a particular site or waste does not ensure that it will be effective at all sites or that the treatment efficiency achieved will be acceptable at other sites. For the ratings used for this table, demonstrated effectiveness means that, at some scale, treatability was tested to show that, for that particular contaminant and matrix, the technology was effective. The ratings of potential effectiveness and no expected effectiveness are based upon expert judgement. Where potential effectiveness is indicated, the technology is believed capable of successfully treating the contaminant group in a particular matrix. When the technology is not applicable or will probably not work for a particular combination of contaminant group and matrix, a no-expected-effectiveness rating is given.

The effectiveness of GAC is related to the chemical composition and molecular structure of the contaminant. Or-

■ Demonstrated Effectiveness: Successful treatability test at some scale completed

▼ Potential Effectiveness: Expert opinion that technology will work.

❑ No Expected Effectiveness: Expert opinion that technology will not work

[a] Technology is effective for some contaminants in the group; it may not be effective for others.

[b] Applications to these contaminants involve both adsorption and chemical reaction.

ganic wastes that can be treated by GAC include compounds with high molecular weights and boiling points and low solubility and polarity [6]. Organic compounds treatable by GAC are listed in Table 2. GAC has also been used to remove low concentrations of certain types of inorganics and metals; however, it is not widely used for this application [1, p. 6-13].

Almost all organic compounds can be adsorbed onto GAC to some degree [2, p. 5-17]. The process is frequently used when the chemical composition of the stream is not fully analyzed [1, p. 6-3]. Because of its wide-scale use, GAC has probably been inappropriately selected when an alternative technology may have been more effective [7]. GAC can be used in conjunction with other treatment technologies. For example, GAC can be used to remove contaminants from the offgas from air stripper and soil vapor extraction operations [7] [8, p. 73] [9].

Table 2
Organic Compounds Amenable to Adsorption by GAC [1]

Class	Example
Aromatic solvents	Benzene, toluene, xylene
Polynuclear aromatics	Naphthalene, biphenyl
Chlorinated aromatics	Chlorobenzene, PCBs, endrin, toxaphene, DDT
Phenolics	Phenol, cresol, resorcinol, nitrophenols, chlorophenols, alkyl phenols
Aromatic amines and high molecular weight aliphatic amines	Aniline, toluene diamine
Surfactants	Alkyl benzene sulfonates
Soluble organic dyes	Methylene blue, textile dyes
Fuels	Gasoline, kerosene, oil
Chlorinated solvents	Carbon tetrachloride, perchloroethylene
Aliphatic and aromatic acids	Tar acids, benzoic acids
Pesticides/herbicides	2,4-D, atrazine, simazine, aldicarb, alachlor, carbofuran

Limitations

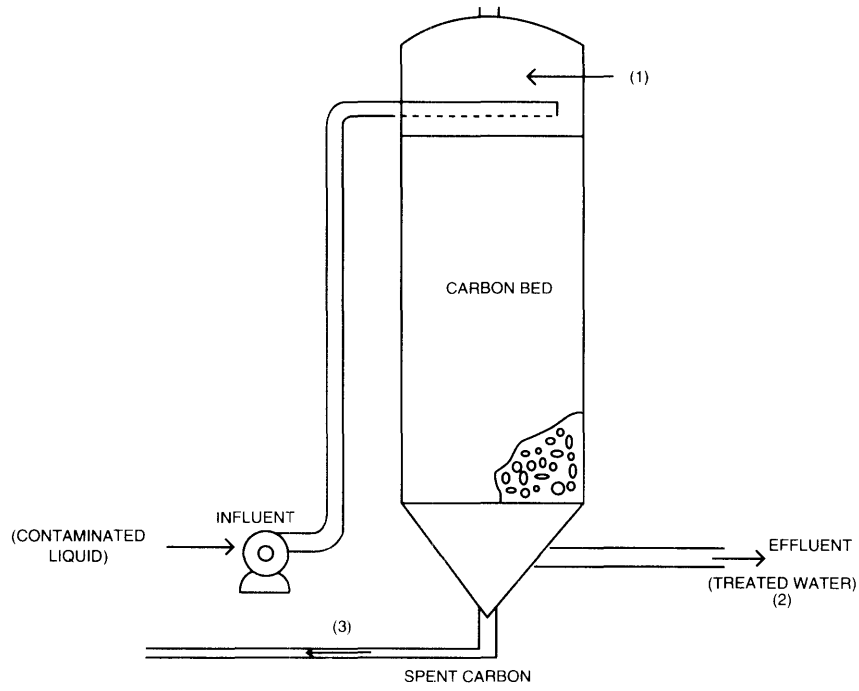
Compounds that have low molecular weight and high polarity are not recommended for GAC treatment. Streams with high suspended solids (≥ 50 mg/L) and oil and grease (≥ 10 mg/L) may cause fouling of the carbon and require frequent backwashing. In such cases, pretreatment prior to GAC, is generally required. High levels of organic matter (e.g., 1,000 mg/L) may result in rapid exhaustion of the carbon. Even lower levels of background organic matter (e.g., 10-100 mg/L) such as fulvic and humic acids may cause interferences in the adsorption of specifically targeted organic contaminants which are present in lower concentrations. In such cases, GAC may be most effectively employed as a polishing step in conjunction with other treatments.

The amount of carbon required, regeneration/reactivation frequency, and the potential need to handle the discarded GAC as a hazardous waste are among the important economic considerations. Compounds not well adsorbed often require large quantities of GAC, and this will increase the costs. In some cases the spent GAC may be a hazardous waste, which can significantly add to the cost of treatment.

Technology Description

Carbon is an excellent adsorbent because of its large surface area, which can range from 500-2000 m^2/g, and because its diverse surfaces are highly attractive to many different types of contaminants [3]. To maximize the amount of surface available

Figure 1. Schematic Diagram of Fixed-Bed GAC System



for adsorption, an activation process which increases the surface-to-volume ratio of the carbon is used to produce an extensive network of internal pores. In this process, carbonaceous materials are converted to mixtures of gas, tars, and ash. The tar is then burned off and the gases are allowed to escape to produce a series of internal micropores [1, p. 6-6]. Additional processing of the GAC may be used to render it more suitable for certain applications (e.g. impregnation for mercury or sulfur removal).

The process of adsorption takes place in three steps [3]. First the contaminant migrates to the external surface of the GAC granules. It then diffuses into the GAC pore structure. Finally, a physical or chemical bond forms between the contaminant and the internal carbon surface.

The two most common reactor configurations for GAC adsorption systems are the fixed bed and the pulsed or moving bed [3]. The fixed-bed configuration is the most widely used for adsorption from liquids, particularly for low to moderate concentrations of contaminants. GAC treatment of contaminated gas streams is done almost exclusively in fixed-bed reactors. The following technical discussion applies to both gas and liquid streams.

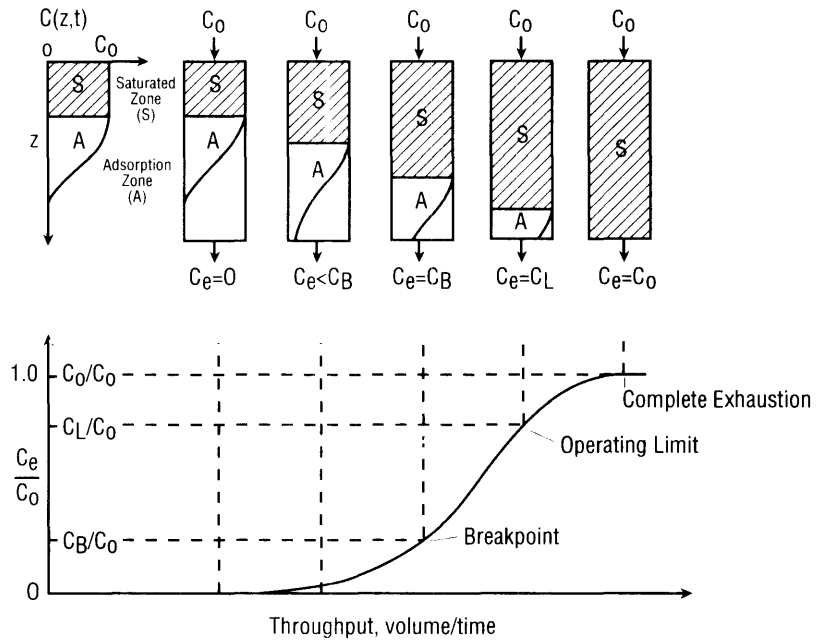
Figure 1 is a schematic diagram of a typical single-stage, fixed-bed GAC system for use on a liquid stream. The contaminant stream enters the top of the column (1). As the waste stream flows through the column, the contaminants are adsorbed. The treated stream (effluent) exits out the bottom (2). Spent carbon is reactivated, regenerated, or replaced once the effluent no longer meets the treatment objective (3). Although Figure 1 depicts a downward flow, the flow direction can be upward, depending on design considerations.

Suspended solids in a liquid stream or particulate matter in a gaseous stream accumulate in the column, causing an increase in pressure drop. When the pressure drop becomes too high, the accumulated solids must be removed, for example by backwashing. The solids removal process necessitates adsorber downtime, and may result in carbon loss and disruption of the mass transfer zone. Pretreatment for removal of solids from streams to be treated by GAC is, therefore, an important design consideration.

As a GAC system continues to operate, the mass-transfer zone moves down the column. Figure 2 shows the adsorption pattern and the corresponding effluent breakthrough curve [3]. The breakthrough curve is a plot of the ratio of effluent concentration (C_e) to influent concentration (C_o) as a function of water volume or air volume treated per unit time. When a predetermined concentration appears in the effluent (C_B), breakthrough has occurred. At this point, the effluent quality no longer meets treatment objectives. When the carbon becomes so saturated with the contaminants that they can no longer be adsorbed, the carbon is said to be spent (C_e=C_o). Alternative design arrangements may allow individual adsorbers in multi-adsorber systems to be operated beyond the breakpoint as far as complete exhaustion. This condition of operation is defined as the operating limit (C_e=C_L) of the adsorber.

The major design variables for liquid phase applications of GAC are empty bed contact time (EBCT), GAC usage rate, and system configuration. Particle size and hydraulic loading are often chosen to minimize pressure drop and reduce or eliminate backwashing. System configuration and EBCT have an impact on GAC usage rate. When the bed life is longer than 6 months and the treatment objective is stringent ($C_e/C_o < 0.05$),

Figure 2
Breakthrough Characteristics of Fixed-Bed GAC Adsorper [3]



a single adsorber or a combination of single beds operating in parallel is preferred. For a single adsorber, the EBCT is normally chosen to be large enough to minimize GAC usage rate. When less stringent objectives are required ($C_e/C_o > 0.3$), blending of effluents from partially saturated adsorbers can be used to reduce GAC usage rate. When stringent treatment objectives are required ($C_e/C_o < 0.05$) and GAC bed life is short (less than 6 months) multiple beds in series may be used to decrease GAC usage rate.

For gas-phase applications, the mass transfer zone is usually very short if the relative humidity is low enough to prevent water from filling the GAC pores. The adsorption zone (Figure 2) for gas-phase applications is small relative to bed depth, and the GAC is nearly saturated at the breakpoint. Accordingly, EBCT and system configuration have little impact on GAC usage rate and a single bed or single beds operated in parallel are commonly used.

GAC can be reactivated either onsite or offsite. The choice is usually dictated by costs which are dependent on the site and on the proximity of offsite facilities that reactivate carbon. Generally onsite reactivation is not economical unless more than 2,000 pounds per day of GAC are required to be reactivated. Even so, an offsite reactivation service may be more cost effective [10].

The basic evaluation technique for initial assessment of the feasibility of GAC treatment is the adsorption isotherm test. This test determines if a compound is amenable to GAC adsorption and can be used to estimate minimum GAC usage rates. More detailed testing such as small-scale column tests and pilot tests should be conducted if the isotherms indicate GAC can produce an effluent of acceptable quality at a reasonable carbon usage rate [10].

Process Residuals

The main process residual produced from a GAC system is the spent carbon containing the hazardous contaminants. When the carbon is regenerated, the desorbed contaminants must be treated or reclaimed. Reactivation of carbon is typically accomplished by thermal processes. Elevated temperatures are employed in the furnace and afterburners to destroy the accumulated contaminants. If the carbon cannot be economically reactivated, the carbon must be discarded and may have to be treated and disposed of as a hazardous waste. In some cases, the influent to GAC treatment must be pretreated to prevent excessive head loss. Residues from pretreatment (e.g. filtered suspended solids) must be treated or disposed. Solids collected from backwashing may need to be treated and disposed of as a hazardous waste.

Site Requirements

GAC equipment generally has small space requirements and sometimes can be incorporated in mobile units. The rapidity of startup and shutdown also makes GAC amenable to mobile treatment. Carbon beds or columns can be skid-mounted and transported by truck or rail [2, p. 5-19].

As previously stated, spent carbon from the treatment of streams containing hazardous substances is generally considered hazardous, and its transportation and handling requires that a site safety plan be developed to provide for personnel protection and special handling measures. Storage may have to be provided to hold the GAC-treated liquid until its acceptability for release has been determined. If additional treatment is required, adequate space must be provided for these systems.

Performance Data

Performance data on full-scale GAC systems have been reported by several sources including equipment vendors. Data on GAC systems at several Superfund sites and other cleanup sites are discussed in this section. The data presented for specific contaminant removal effectiveness were obtained from publications developed by the respective GAC system vendors. The quality of this information has not been determined; however, it does give an indication of the efficiency of GAC.

A GAC system was employed for leachate treatment at the Love Canal Superfund site in Niagara Falls, New York. The results of this operation are listed in Tables 3 and 4 [11].

Table 5 summarizes a number of experiences by Calgon Corporation in treating contaminated groundwater at many other non-Superfund sites. Table 5 identifies the sources of contamination along with operating parameters and results [12]. While these sites were not regulated under CERCLA, the type and concentration of contaminants are typical of those encountered at a Superfund site.

The Verona Well Field Superfund site in Battle Creek, Michigan used GAC as a pretreatment for the air stripper. This arrangement reduced the influent concentrations which allowed the air stripper to comply with the National Pollution Discharge Elimination System (NPDES) permit. The system had two parallel trains: a single unit and two units in series. Approximately one-third of the total flow was directed to the first train while the remaining flow went to the other train. Performance data for removal of total volatile organic compounds (TVOC) on selected operating days are given in Table 6 [13].

A remediation action at the U.S. Coast Guard Air Station in Traverse City, Michigan, resulted in GAC being used to treat contaminated groundwater. The groundwater was pumped from the extraction well system to the GAC system. The treated water was then discharged to the municipal sewer system. Concentrations of toluene in the monitoring wells were reduced from 10,329 parts per billion (ppb) to less than 10 ppb in approximately 100 days [14].

Technology Status

GAC is a well-proven technology. It has been used in the treatment of contaminated groundwater at a number of Superfund sites. Carbon adsorption has also been used as a polishing step following other treatment units at many sites. In 1988, the number of sites where activated carbon was listed in the Record of Decision was 28; in 1989, that number was 38.

Costs associated with GAC are dependent on waste stream flow rates, type of contaminant, concentrations, and site and timing requirements. Costs are lower with lower concentration levels of a contaminant of a given type. Costs are also lower at higher flow rates. At liquid flow rates of 100-million gallons per day (mgd), costs range from $0.10 - 1.50/1,000 gallons treated. At flow rates of 0.1 mgd, costs increase to $1.20 - 6.30/1,000 gallons treated [12].
